<sup>a</sup> See also (1979EN05). The last column gives the  $\gamma$ -ray strengths expressed in Weisskopf units (see D.H. Wilkinson, in *Nuclear spectroscopy B*, ed. F. Ajzenberg-Selove (Academic Press, New York, 1960)). The Weisskopf estimates ( $\Gamma_W$  in eV,  $E_\gamma$  in MeV) are:

$$\begin{aligned}\Gamma_W(E1) &= 6.8 \times 10^{-2} A^{2/3} E_\gamma^3, & \Gamma_W(E2) &= 4.9 \times 10^{-8} A^{4/3} E_\gamma^5, \\ \Gamma_W(E3) &= 2.3 \times 10^{-14} A^2 E_\gamma^7, & \Gamma_W(M1) &= 2.1 \times 10^{-2} E_\gamma^3, \\ \Gamma_W(M2) &= 1.5 \times 10^{-8} A^{2/3} E_\gamma^5, & \Gamma_W(M3) &= 6.8 \times 10^{-15} A^{4/3} E_\gamma^7.\end{aligned}$$

The values for these  $\gamma$ -ray strengths are occasionally different from those listed in other tables of this paper because different values of  $r$  were used. In this table  $r_0 = 1.2$  fm is used consistently. We acknowledge with deep appreciation the very helpful criticisms of P.M. Endt. For mixing ratios see Table 2 in (1981AJ01) except when changed values are footnoted.
