

# Energy Levels of Light Nuclei

## $A = 6$

F. Ajzenberg-Selove

*University of Pennsylvania, Philadelphia, Pennsylvania 19104-6396*

**Abstract:** An evaluation of  $A = 5\text{--}10$  was published in *Nuclear Physics A413* (1984), p. 1. This version of  $A = 6$  differs from the published version in that we have corrected some errors discovered after the article went to press. Figures and introductory tables have been omitted from this manuscript. Also, [Reference](#) key numbers have been changed to the TUNL/NNDC format.

(References closed June 1, 1983)

The original work of Fay Ajzenberg-Selove was supported by the US Department of Energy [DE-FG02-86ER40279]. Later modification by the TUNL Data Evaluation group was supported by the US Department of Energy, Office of High Energy and Nuclear Physics, under: Contract No. DEFG05-88-ER40441 (North Carolina State University); Contract No. DEFG05-91-ER40619 (Duke University).

## Table of Contents for $A = 6$

*Below is a list of links for items found within the PDF document. Figures from this evaluation have been scanned and are available on this website or via the link below.*

A. Nuclides:  $^6\text{n}$ ,  $^6\text{H}$ ,  $^6\text{He}$ ,  $^6\text{Li}$ ,  $^6\text{Be}$ ,  $^6\text{B}$ ,  $^6\text{C}$

B. Tables of Recommended Level Energies:

**Table 6.1:** Energy levels of  $^6\text{He}$

**Table 6.2:** Energy levels of  $^6\text{Li}$

**Table 6.6:** Energy levels of  $^6\text{Be}$

C. References

D. Figures:  $^6\text{He}$ ,  $^6\text{Li}$ ,  $^6\text{Be}$ , Isobar diagram

E. Erratum to this Publication: [PS](#) or [PDF](#)

**$^6\text{n}$**   
(Not illustrated)

$^6\text{n}$  has not been observed in the interaction of 700 MeV protons or of 400 GeV protons with uranium: the cross section is  $< 1.1 \times 10^{-3} \mu\text{b}$  (1977TU02; 700 MeV),  $< 9 \mu\text{b}$  (1977TU03; 400 GeV). See also (1979AJ01).

**$^6\text{H}$**   
(Not illustrated)

$^6\text{H}$  has not been observed: see (1974AJ01). The population of excited states of  $^6\text{H}_\Sigma$  [a  $\Sigma^-$  hyperon in resonance with a  $^5\text{He}$  core] is reported by (1982PI02). See also (1982DO1C, 1982DO04, 1982DO1M; theor.).

**$^6\text{He}$**   
(Figs. 4 and 7)

GENERAL: (See also (1979AJ01).)

*Model calculations:* (1979SHZV, 1980FI1D, 1981KU13, 1982FI13, 1982KR1B, 1982LE11, 1982VO01).

*Special states:* (1982FI13, 1983DE16, 1983KR05, 1983LE01).

*Electromagnetic transitions:* (1982AW02).

*Complex reactions involving  $^6\text{He}$ :* (1978DU1B, 1978VO1A, 1979BO22, 1979VI05, 1980BO31, 1980WI1L, 1981BO1X, 1981CU05, 1981VO10, 1982BO1Q, 1982BO35, 1982BO40, 1982GU1H, 1982HE1D, 1983JA1C).

*Muon and neutrino capture and reactions:* (1978SE1B, 1979DE1D, 1979WA1D, 1980BR1A, 1980MU1B).

*Reactions involving pion and other mesons:* (1978FU09, 1979BA16, 1979BA1M, 1979DO1C, 1979PE1C, 1979SH1D, 1979WI1A, 1980BE20, 1981BA1M, 1981DU1H, 1981NI03, 1981SH06, 1982BO11).

*Hypernuclei:* (1978PO1A, 1978SO1A, 1980VE2B, 1981BA2P, 1981WA1J, 1982BA1Y, 1982BA2N, 1982BA2R, 1982KO1L).

*Other topics:* (1978FI12, 1979SHZV, 1979VA1A, 1981PAZZ, 1982AW02, 1982MO1Q, 1982NG01, 1982ZO1B, 1983BA2F, 1983BA3A, 1983DE16, 1983NA03).

*Ground state of  $^6\text{He}$ :* (1978SM02, 1981AV02, 1981PAZZ, 1982FI13, 1982KR1B, 1982LE11, 1982NG01, 1982VO01, 1983LE01).

Table 6.1: Energy levels of  ${}^6\text{He}$ 

| $E_x$ (MeV $\pm$ keV) | $J^\pi; T$ | $\tau_{1/2}$ or $\Gamma_{\text{c.m.}}$ | Decay       | Reactions   |
|-----------------------|------------|--|-------------|---|
| g.s.                  | $0^+; 1$   | $\tau_{1/2} = 806.7 \pm 1.5$ msec      | $\beta^-$   | 1, 3, 4, 5, 6, 7, 8, 9,<br>10, 11, 12, 13, 14,<br>15, 16, 17, 18, 19,<br>20, 21 |
| $1.797 \pm 25$        | $(2)^+; 1$ | $\Gamma = 113 \pm 20$ keV              | $n, \alpha$ | 3, 5, 6, 8, 9, 11, 12,<br>13, 14, 15, 16, 19,<br>20                             |
| $(13.6 \pm 500)$      |            | broad                                  |             | 13, 14  |
| $(15.5 \pm 400)$      |            | broad                                  | $\gamma$    | 6, 12, 13, 17   |
| $(23.2 \pm 700)$      |            | broad                                  | $\gamma$    | 6, 13   |

The decay proceeds to the ground state of  ${}^6\text{Li}$  [ $J^\pi = 1^+$ ] and is a super-allowed Gamow-Teller transition. Recent half-life measurements are  $808.1 \pm 2.0$  msec ([1974WI14](#)),  $798.1 \pm 1.0$  msec ([1981BA58](#)),  $805.4 \pm 2.0$  msec ([1982AL17](#)): see Table 6.2 in ([1966LA04](#)) for a listing of earlier determinations. We adopt the mean of the ([1974WI14](#), [1982AL17](#)) values,  $\tau_{1/2} = 806.7 \pm 1.5$  msec;  $\log ft = 2.910 \pm 0.002$ . See also ([1979AJ01](#), [1979DO1A](#)) and ([1977SA1A](#), [1978SE1B](#), [1979DE15](#), [1981PAZZ](#); theor.).

|  |                 |                |
|--|-----------------|----------------|
| 2. (a) ${}^3\text{H}(t, n){}^5\text{He}$ | $Q_m = 10.44$   | $E_b = 12.305$ |
| (b) ${}^3\text{H}(t, 2n){}^4\text{He}$   | $Q_m = 11.3322$ |                |
| (c) ${}^3\text{H}(t, d){}^4\text{H}$     | $Q_m = -8.9$    |                |
| (d) ${}^3\text{H}(t, 3n){}^3\text{He}$   | $Q_m = -9.2456$ |                |
| (e) ${}^3\text{H}(t, t){}^3\text{H}$     |                 |                |

The cross section for neutron production (reactions (a) and (b)) rises monotonically from 40 keV to 2.2 MeV. The zero-energy cross section factor  $S_0 \approx 300$  keV · b. The cross section for reaction (b) increases monotonically for  $E_t = 34$  to 160 keV. ([1981JA1F](#)) suggests that the (t, 2n) cross sections below  $E_t = 300$  keV are poorly known and may be subject to large systematic errors. For the earlier work on these reactions, and for references, see ([1974AJ01](#), [1979AJ01](#)). See also ([1979OH1B](#), [1981HA1P](#)), ([1982SL1A](#)) and ([1979HA1C](#), [1980HA1Y](#), [1981GE1C](#); theor.).

Angular distributions of the protons to  ${}^6\text{He}^*(0, 1.80)$  have been measured at  $E_t = 22$  and  $23$  MeV. [No  $L$ -values were assigned.] No other states are observed with  $E_x \lesssim 4.2$  MeV: see ([1979AJ01](#)).

See ([1978GL03](#), [1982GL01](#)):  $E_\alpha = 61.5 \rightarrow 158.2$  MeV. See also  ${}^8\text{Be}$ .

From measurements at  $E_e = 170, 180$  and  $195$  MeV, angular distributions of  $(\gamma, \pi^+)$  to  ${}^6\text{He}^*(0, 1.80)$  are derived by ([1979SH1D](#), [1981SH06](#)).

The excitation of  ${}^6\text{He}^*(0, 1.8)$  and possibly of (broad) states at  $E_x = 15.6 \pm 0.5, 23.2 \pm 0.7$  and  $29.7 \pm 1.3$  MeV is reported by ([1973BA62](#)) from  $E_\gamma$  measurements using a pair spectrometer. See also ([1979AJ01](#)). The charge-exchange process with stopped pions (reaction (b)) has been studied by ([1981BA16](#)).

Angular distributions of the  $p_0$  group are reported at  $E_n = 4.7$  to  $6.8$  MeV and at  $14$  MeV [see ([1979AJ01](#))] and at  $E_n = 59.6$  MeV ([1982BR04](#)). There is no evidence for the excitation of  ${}^6\text{He}^*(1.8)$  ([1982BR04](#)). See also ([1980MI02](#)) and  ${}^7\text{Li}$ .

At  $E_d = 55$  MeV the population of  ${}^6\text{He}^*(0, 1.8)$  [the latter weak] is observed: no other states are observed with  $E_x \lesssim 25$  MeV ([1979ST15](#)).

The ground-state angular distribution has been studied at  $E_t = 17$  MeV. At  $E_t = 22$  MeV only  ${}^6\text{He}^*(0, 1.8)$  are populated with  $E_x \lesssim 8.5$  MeV. See (1979AJ01) for additional discussion and for references. See also (1983AB1A).

Angular distributions have been studied at  $E({}^6\text{Li}) = 32$  and  $36$  MeV for the transitions to  ${}^6\text{He}_{\text{g.s.}}$ ,  ${}^6\text{Be}_{\text{g.s.}}$  and, in inelastic scattering of  ${}^6\text{Li}$  [see  ${}^6\text{Li}$ ], to the analog state  ${}^6\text{Li}^*(3.56)$ : for a discussion of these see the references quoted in (1979AJ01).

At  $E({}^7\text{Li}) = 78$  MeV,  ${}^6\text{He}^*(0, 1.8)$  are populated (1982AL1G).

At  $E_\gamma = 60$  MeV, the proton spectrum shows two prominent peaks attributed to  ${}^6\text{He}^*(0 + 1.8, 18 \pm 3)$ : see (1979AJ01). For reaction (b) see (1980AS02:  $E_e = 108, 163$  and  $198$  MeV). See also  ${}^7\text{Li}$ .

At  $E_n = 60$  MeV, the deuteron spectrum shows two prominent peaks attributed to states centered at  $E_x = 13.6, 15.4$  and  $17.7$  MeV ( $\pm 0.5$  MeV) and a possible state or states (populated with an  $l_p$  transfer  $\geq 2$ ) at  $E_x = 23.7$  MeV. DWBA analyses of the  $d_0$  and  $d_1$  groups are consistent with  $l_p = 1$  and  $S(1p_{3/2}) = 0.62$  for  ${}^6\text{He}_{\text{g.s.}}$  and to  $S(1p_{3/2}) = 0.37, S(1p_{1/2}) = 0.32$  for  ${}^6\text{He}^*(1.8)$  (1977BR17). See (1974AJ01) for earlier measurements.

The summed proton spectrum at  $E_p = 100$  MeV shows  ${}^6\text{He}^*(0, 1.8)$  and a broad group centered at  $E_x \approx 14$  MeV: the angular correlation for  ${}^6\text{He}_{\text{g.s.}}$  is in quite good agreement with DWIA: see (1979AJ01).

Angular distributions of the  ${}^3\text{He}$  ions to  ${}^6\text{He}^*(0, 1.8)$  have been measured at  $E_{\text{d}} = 14.4$  and  $22$  MeV: they have an  $l_p = 1$  character and therefore these two states have  $J^\pi = (0 - 3)^+$ . There is no evidence for any other states of  ${}^6\text{He}$  with  $E_x < 10.7$  MeV: see (1979AJ01).

The energy of the first excited state is  $1.797 \pm 0.025$  MeV,  $\Gamma = 113 \pm 20$  keV.  ${}^6\text{He}^*(1.80)$  decays into  ${}^4\text{He} + 2\text{n}$ . The branching ratio  $\Gamma_\gamma/\Gamma_\alpha \leq 2 \times 10^{-6}$ : for  $\Gamma_{\text{c.m.}} = 113 \pm 20$  keV,  $\Gamma_\gamma \leq 0.23$  eV. Angular distributions of the  $\alpha_0$  and  $\alpha_1$  groups have been measured at  $E_t = 13$  and  $22$  MeV. No other  $\alpha$ -groups are reported corresponding to  ${}^6\text{He}$  states with  $E_x < 24$  MeV (region between  $E_x \approx 13$  and  $16$  MeV was obscured by the presence of breakup of  $\alpha$ -particles): see (1979AJ01). See also  ${}^{10}\text{Be}$ .

At  $E({}^3\text{He}) = 120$  MeV a kinematically complete experiment has been carried out by (1980VO1B): in addition to  ${}^6\text{He}_{\text{g.s.}}$  a structure corresponding to  $E_x = 17$  MeV,  $\Gamma < 5$  MeV is reported.

See (1981BA58).

Angular distributions have been reported for  $E_{\text{n}} = 12.2$  to  $18.0$  MeV ( $\alpha_0, \alpha_1$ ). No other states are observed with  $E_x \lesssim 7$  MeV: see (1979AJ01). See also  ${}^{10}\text{Be}$ .

At  $E_t = 21.5$  and  $23.5$  MeV, angular distributions have been studied for the transitions to  ${}^6\text{He}^*(0, 1.8)$  and  ${}^6\text{Li}^*(0, 2.19, 3.56)$ : see (1979AJ01). See also reaction 38 in  ${}^6\text{Li}$  and (1983WE02; theor.).

See (1981DE1X, 1983DE14).

*Ground-state properties of  ${}^6\text{Li}$ :* (1978CH1D, 1978HE1D, 1978KN05, 1978OS07, 1978RO17, 1978ST19, 1979BA01, 1979CA06, 1979OS02, 1979ST09, 1980HO14, 1980MA41, 1981AV02, 1981BO1Y, 1981KU13, 1981PAZZ, 1981SI1G, 1981SU1H, 1981VE04, 1982BA2G, 1982BO31, 1982FI13, 1982KA24, 1982KR1B, 1982KR09, 1982LE11, 1982LO04, 1982LO06, 1982LO09, 1982NG01, 1982PE06, 1982SH1H, 1982VO01, 1983DUZX, 1983KR05, 1983LE01, 1983NI03).

$$\mu = +0.8220467 \text{ (6) nm, } +0.8220560 \text{ (4) nm: see (1978LEZA)}$$

$$Q = -0.644 \text{ (7) mb: see (1978LEZA)}$$

*Mass of  ${}^6\text{Li}$ :* The ground-state mass excess of  ${}^6\text{Li}$  is  $14085.5 \pm 1.1 \text{ keV}$  based on the  $Q$ -value of  ${}^6\text{Li}(p, \alpha){}^3\text{He}$  [ $Q_0 = 4018.2 \pm 1.1 \text{ keV}$ ]. A comparison with previous measurements leads to a new mass excess for  ${}^6\text{Li}$  of  $14086.2 \pm 0.6 \text{ keV}$  (1981RO02). Recently A.H. Wapstra (private communication) has adopted  $14085.4 \pm 0.6 \text{ keV}$  and we shall also.

Capture  $\gamma$ -rays (reaction (a)) to the first three states of  ${}^6\text{Li}$  [ $\gamma_0, \gamma_1, \gamma_2$ ] have been observed for  $E({}^3\text{He}) = 0.5$  to  $25.8$  MeV, while the yields of  $\gamma_3$  and  $\gamma_4$  have been measured for  $E({}^3\text{He}) = 12.6$  to  $25.8$  MeV: see (1974AJ01). The  $\gamma_2$  excitation function does not show resonance structure. However, the  $\gamma_0, \gamma_1, \gamma_3$  and  $\gamma_4$  yields do show broad maxima at  $E({}^3\text{He}) = 5.0 \pm 0.4$  [ $\gamma_0, \gamma_1$ ],  $20.6 \pm 0.4$  [ $\gamma_1$ ],  $\approx 21$  [ $\gamma_3$ ] and  $21.8 \pm 0.8$  [ $\gamma_4$ ] MeV. The magnitude of the ground-state-capture cross section is well accounted for by a direct-capture model; that for the  $\gamma_1$  capture indicates a non-direct contribution above  $E({}^3\text{He}) = 10$  MeV, interpreted as a resonance due to a state with  $E_x = 25 \pm 1$  MeV,  $\Gamma_{\text{c.m.}} = 4$  MeV,  $T = 1$  (because the transition is E1, to a  $T = 0$  final state) [the E1 radiative width  $|M|^2 \gtrsim 5.2/(2J+1)$  W.u.],  $J^\pi = (2, 3, 4)^-$ ,  $\alpha + p + n$  parentage. The  $\gamma_4$  resonance is interpreted as being due to a broad state at  $E_x = 26.6$  MeV with  $T = 0$ .  $J^\pi = 3^-$  is consistent with the measured angular distribution. The ground and first excited state reduced widths for  ${}^3\text{He} + t$  parentage,  $\theta_0^2 = 0.8 \pm 0.2$  and  $\theta_1^2 = 0.6 \pm 0.3$  (1973VE1B).

The angular distribution and polarization of the neutrons in reaction (d) have been measured at  $E({}^3\text{He}) = 2.70$  and  $3.55$  MeV. The excitation function for  $E({}^3\text{He}) = 0.7$  to  $3.8$  MeV decreases monotonically with energy. The excitation function for  $n_0$  has been measured for  $E({}^3\text{He}) = 2$  to  $6$  MeV and for  $E({}^3\text{He}) = 14$  to  $26$  MeV; evidence for a broad structure at  $E({}^3\text{He}) = 20.5 \pm 0.8$  MeV is reported [ ${}^6\text{Li}^*(26.1)$ ]: see (1979AJ01).

Angular distributions of deuterons (reaction (e)) have been measured for  $E_t = 1.04$  to  $3.27$  MeV and at  $E({}^3\text{He}) = 0.29$  to  $32$  MeV. Polarization measurements are reported for  $E_t = 9.02, 12.86$  and  $17.02$  MeV and an excitation function for  $E_t = 9.02$  to  $17.27$  MeV: see (1979AJ01). See also (1978ZA06).

Elastic scattering (reaction (f)) angular distributions have been measured at  $E({}^3\text{He}) = 5.00$  to  $32.3$  MeV and excitation functions have been reported for  $E({}^3\text{He}) = 4.3$  to  $33.4$  MeV: see (1974AJ01) and (1977VL01). At the lower energies the elastic yield is structureless and decreases monotonically with energy. Polarization measurements are reported for  $E_t = 9.02$  to  $17.02$  MeV (1977HA17) and  $E({}^3\text{He}) = 19.9 \rightarrow 33.3$  MeV (1977KA10, 1977VL01). A strong change occurs in the analyzing power angular distributions at  $E_t = 15$  MeV (1977HA17). A phase-shift analysis by (1977VL01) [single-level  $R$ -matrix formalism,  $L \leq 4$ ] yields P-states [ $0^-, 2^-; T = 1$ ] at  $E_x \approx 21.5$  and  $21.0$  MeV and F-states [ $3^-, 4^-; T = 1$ ] at  $E_x \approx 26.7$  and  $25.7$  MeV. There is some indication also of  $T = 0, 3^-, 5^-$  and  $3^+$  states at  $E_x \approx 25, 29.5$  and  $31.5$  MeV whose decay is presumably primarily by  $d + \alpha$  (1977VL01).

At  $E({}^3\text{He}) = 50, 65$  and  $78$  MeV (1979LA14) have examined reactions (g), (h), (i), (j) and have compared the results with PWIA: deviations are observed. See also (1966LA04, 1974AJ01) and (1978FE08, 1978TA1A; theor.).

|   |                 |
|---|-----------------|
| 2. ${}^3\text{H}(\alpha, n){}^6\text{Li}$ | $Q_m = -4.7820$ |
|---|-----------------|

Neutron groups corresponding to  ${}^6\text{Li}^*(0, 2.19)$  have been detected: see  ${}^7\text{Li}$  and (1974AJ01).

At  $E({}^3\text{He}) = 268.5$  and  $282$  MeV  ${}^6\text{Li}^*(0, 2.19, 3.56)$  are populated with cross sections in the range  $9 - 43$  nb/sr at  $\theta_{\text{lab}} = 20^\circ - 60^\circ$  ([1981LE24](#)). See also ([1982LE1L](#), [1982WA1G](#)), ([1982HU1F](#)) and ([1981GE07](#), [1981KL07](#); theor.).

The cross section for the capture cross section has been measured for  $E_\alpha = 3$  to  $25$  MeV by detecting the recoiling  ${}^6\text{Li}$  ions: the direct capture is overwhelmingly E2 with a small E1 contribution. The spectroscopic overlap between the  ${}^6\text{Li}_{\text{g.s.}}$  and  $\alpha + \text{d}$  is  $0.85 \pm 0.04$ . The results show that the production of  ${}^6\text{Li}$  in the big bang is five times smaller than previously calculated ([1981RO12](#)).

|   |                  |                |
|---|------------------|----------------|
| 5. (a) ${}^4\text{He}(\text{d}, \text{n}) {}^5\text{Li}$        | $Q_m = -4.19$    | $E_b = 1.4753$ |
| (b) ${}^4\text{He}(\text{d}, \text{p}) {}^5\text{He}$           | $Q_m = -3.11$    |                |
| (c) ${}^4\text{He}(\text{d}, \text{np}) {}^4\text{He}$          | $Q_m = -2.2246$  |                |
| (d) ${}^4\text{He}(\text{d}, \text{t}) {}^3\text{He}$           | $Q_m = -14.3205$ |                |
| (e) ${}^4\text{He}(\text{d}, \text{d}) \text{p} + {}^3\text{H}$ | $Q_m = -19.8140$ |                |
| (f) ${}^4\text{He}(\text{d}, \text{d}) {}^2\text{H}^2\text{H}$  | $Q_m = -23.8467$ |                |

The proton yield gives no evidence of states in  ${}^6\text{Li}$  with  $6.5 < E_x < 8.7$  MeV. Polarization measurements at  $E_{\text{d}} = 8.5, 10$  and  $11$  MeV indicate scattering through the first two states of  ${}^5\text{He}$ . See also  ${}^5\text{He}$  and  ${}^5\text{Li}$ , ([1974AJ01](#)), and ([1978LE10](#);  $E_\alpha = 100$  MeV; polarization of n).

Reaction (c) has been studied to  $E_\alpha = 165$  MeV: see ([1979AJ01](#)). Kinematically complete experiments have been reported recently at  $E_\alpha = 9.74$  to  $11.30$  MeV ([1980DA05](#), [1980DA17](#)),  $9.85$  to  $13.99$  MeV ([1982BR17](#)),  $10.27, 11.3$  and  $13$  MeV ([1981BR25](#)) and  $13, 15$  and  $18$  MeV ([1982GL10](#)), at  $E_{\text{d}} = 12$  and  $17$  MeV ([1983SL01](#)),  $14$  MeV ([1982ST16](#)) and at  $E_{\text{d}} = 18$  MeV ([1981OS02](#): VAP and differential cross sections). ([1980DA05](#), [1980DA17](#)) find that three-body forces are required to understand the results and suggest that  ${}^6\text{Li}^*(4.3)$  may be involved. At  $E_\alpha = 140$  MeV three-body model calculations are in good agreement with the experimental data ([1982LA14](#)). The isospin-forbidden proton-neutron FSI in the  ${}^1S_0, T = 1$  state account for bumps observed near  $E_{\text{pn}} = 0$  ([1982ST16](#)).

At  $E_\alpha = 28.3$  MeV ([1979AN24](#), [1981BE1G](#)) report measurements of the angular correlation between the n and  ${}^5\vec{\text{Li}}$  and the angular distribution of the subsequent decay to  ${}^4\text{He} + \text{p}$ , permitting the calculation of the tensor moments of  ${}^5\text{Li}$ . Polarization measurements are reported at  $E_{\text{d}} = 5.4, 6.1$  and  $6.8$  MeV ([1982LUZX](#)),  $12$  and  $17$  MeV ([1983SL01](#)) and  $12.0$  and  $21.0$  MeV ([1982IS06](#)). For total cross sections for reaction (c) see ([1979GR10](#):  $E_\alpha = 20.4, 24.2, 28.1$  MeV). See also ([1977KO42](#), [1982WI09](#)). For a spallation study at an  $\alpha$ -momentum of  $4$  GeV/c see ([1981BE1R](#)).

Reaction (d) has been studied at  $E_d = 32.4$  MeV,  $E_d = 45.8$  MeV and  $E_\alpha = 48.3$  to 166 MeV: see (1979AJ01). For reaction (e) see (1974AJ01). See also (1981NO1B) and (1978NA12, 1978TA1A, 1978TH1A, 1980KO04, 1980ME02, 1981BO1Q, 1981WE10; theor.).

Elastic differential cross-section measurements have been studied at many energies up to  $E_\alpha = 166$  MeV and polarization measurements have been carried out for  $E_d$  to 45 MeV: see (1974AJ01, 1979AJ01). Recent measurements are reported at  $E_\alpha = 5.96$  to 13.91 MeV (1980BR19, 1982BR09;  $\sigma(\theta)$ ) and 28.5 MeV (1982WI09),  $E_d = 0.87$  to 1.43 MeV (1979BA30, 1980BA60;  $\sigma(\theta)$ , VAP),  $E_d = 8 - 13$  MeV (1983JE03; VAP, TAP), 11.9 MeV (1981EL1A; polarization transfer coefficient at  $\theta = 37^\circ$ ), 12 to 17 MeV (1979GR13;  $\sigma(\theta)$ , TAP), 12.6 MeV (1981BI1D; VAP, TAP), 17 to 42.8 MeV (1980GR03; VAP, TAP), 17 to 45 MeV (1980ST01;  $\sigma(\theta)$ , TAP) and 20.2 MeV (1980FR01;  $\sigma(\theta)$ , VAP, TAP).

<sup>a</sup> The data in this table are mostly from the  $S$ -matrix analysis of (1983JE03). The results are unique up to  $E_d = 15$  MeV. See also Table 6.4 in (1974AJ01) and Table 6.3 in (1979AJ01).

<sup>b</sup> The errors in  $\Gamma_d/\Gamma$  are typically 0.03.

<sup>c</sup> In units of the Wigner limit  $\gamma_W^2 = 2.93$  MeV for a radius of 4.0 fm. I am indebted to W. Gruebler for pointing out an error to me.

<sup>d</sup>  $E_d = 1067 \pm 3$  keV,  $\Gamma = 20 \pm 2.8$  keV (1979BA30).

<sup>e</sup> 6.26 MeV (1977HA34;  $R$ -matrix analysis):  $E_x = 5.65$  MeV.

Phase-shift analyses have been carried out for  $E_d = 0.3$  to 27 MeV [see (1974AJ01)], and for  $E_d = 3$  to 43 MeV by (1983JE03) [using all available differential cross-section, vector and tensor

analyzing power measurements, and  $L \leq 5$ ], for  $E_d = 6$  to 14 MeV by (1982BR09), as well as in the vicinity of the  $1^+$ ;  $T = 0$  state  ${}^6\text{Li}^*(5.65)$  by (1977HA34) [ $R$ -matrix analysis: see Table 6.3]. On the basis of these analyses it is found that the d-wave shifts are split and exhibit resonances at  $E_x = 2.19$  ( ${}^4D_3$ ), 4.7 ( ${}^3D_2$ ) and 5.65 MeV ( ${}^3D_1$ ). (1983JE03) suggest very broad  $G_3$  and  $G_4$  resonances at  $E_d = (19.3)$  and 33 MeV, a  $D_3$  resonance at 22 MeV and  $F_3$  and  $F_2$  resonances at  $\approx 34$  and  $\approx 39$  MeV: see Table 6.3. The states reported by (1983JE03) are primarily of ( $d+\alpha$ ) parentage. A contour plot of the TAP to  $E_d = 54$  MeV is presented by (1980GR03): it appears that  $A_{yy} \approx 1$  near  $E_d = 35$  MeV,  $\theta_{c.m.} = 150^\circ$ . See also (1980ST01). The total cross section has been measured for momenta of 1.55 and 2.89 GeV/c per nucleon (1978JA16). (1980MC09) looked for narrow resonances, due to quark effects, at deuteron momenta of 2.22 to 5.75 GeV/c: none were observed.

The direct breakup of 22.2 MeV  ${}^6\text{Li}$  on  ${}^{118}\text{Sn}$  was measured in a kinematically complete experiment. The  $d, \alpha$  angular correlation is in agreement with a semi-classical model for Coulomb breakup (1980GE08). (1980RO1B; preliminary) have attempted to see the  $\alpha + d$  (forbidden) breakup of  ${}^6\text{Li}^*(3.56)$  [ $0^+$ ;  $T = 1$ ]:  $\Gamma_\alpha < 1 \times 10^{-5}$  eV. See also (1977BO40, 1979TO1A, 1983YO01), (1978BR1A, 1982FI1C) and (1978IN02, 1978KO07, 1979SE04, 1979SUZW, 1979WI1B, 1980FU1G, 1980KA15, 1980NI07, 1981AO02, 1982KA24, 1982PR02, 1982SA16, 1983AO03, 1983BA2G, 1983SH04; theor.).

$$\begin{aligned} 7. \quad (a) {}^4\text{He}({}^3\text{He}, p){}^6\text{Li} \quad Q_m = -4.0182 \\ (b) {}^4\text{He}({}^3\text{He}, pd){}^4\text{He} \quad Q_m = -5.4936 \end{aligned}$$

Angular distributions have been measured at  $E({}^3\text{He}) = 8$  to 18 MeV and  $E_\alpha = 42, 71.7$  and 81.4 MeV: see (1974AJ01). At  $E_\alpha = 28, 63.7, 71.7$  and 81.4 MeV the  $\alpha$ -spectra show that the sequential decay (reaction (b)) involves  ${}^6\text{Li}^*(2.19)$  and possibly  ${}^5\text{Li}$ : see (1979AJ01). See also  ${}^7\text{Be}$ .

$$\begin{aligned} 8. \quad (a) {}^4\text{He}(\alpha, d){}^6\text{Li} \quad Q_m = -22.3714 \\ (b) {}^4\text{He}(\alpha, \alpha d){}^2\text{H} \quad Q_m = -23.84673 \end{aligned}$$

Reaction (a) has been studied to  $E_\alpha = 158.2$  MeV: see (1979AJ01) and (1979AL34, 1982GL01). For reaction (b) [and excited states of  ${}^4\text{He}$ ] see (1980KA20;  $E_\alpha = 119$  MeV);  ${}^6\text{Li}^*(2.19)$  is involved in the process.

$$9. {}^6\text{He}(\beta^-){}^6\text{Li} \quad Q_m = 3.507$$

See  ${}^6\text{He}$ .

|  |                  |
|--|------------------|
| 10. (a) ${}^6\text{Li}(\gamma, \text{n}){}^5\text{Li}$ | $Q_m = -5.66$    |
| (b) ${}^6\text{Li}(\gamma, \text{p}){}^5\text{He}$     | $Q_m = -4.59$    |
| (c) ${}^6\text{Li}(\gamma, \text{d}){}^4\text{He}$     | $Q_m = -1.4753$  |
| (d) ${}^6\text{Li}(\gamma, \text{t}){}^3\text{He}$     | $Q_m = -15.7958$ |

The  $(\gamma, \text{n})$  and  $(\gamma, xn)$  cross sections increase from threshold to a maximum at  $E_\gamma \approx 12$  MeV then decrease to  $E_\gamma = 32$  MeV without clear evidence of additional structure. The cross section for photoproduction (reaction (b)) is generally flat up to 90 MeV. [The previously reported hump at  $E_\gamma \approx 16$  MeV is almost certainly due to oxygen contamination ([1979SK02](#)).] The integrated cross section for  $6.4 \rightarrow 30$  MeV is  $16.3 \pm 2.5$  MeV · mb ([1979JU02](#)). The cross section for reaction (c) is  $\lesssim 5 \mu\text{b}$  in the range  $E_\gamma = 2.6$  to 17 MeV consistent with the expected inhibition of dipole absorption by isospin selection rules: see ([1966LA04](#)). See also ([1979JU02](#), [1982KIZW](#)). The  $90^\circ$  differential cross section for reaction (d) decreases monotonically for  $E_\gamma = 18$  to 70 MeV: reaction (d) contributes  $\approx \frac{1}{3}$  of the total cross section for  ${}^6\text{Li} + \gamma$ , consistent with a  ${}^3\text{H} + {}^3\text{He}$  cluster description of  ${}^6\text{Li}_{\text{g.s.}}$  with  $\theta^2 \approx 0.68$ . The agreement with the inverse reaction,  ${}^3\text{H}({}^3\text{He}, \gamma)$  [see reaction 1] is good. The integrated cross section for  $20 \rightarrow 30$  MeV is  $7.0 \pm 1.0$  MeV · mb ([1979JU02](#)). See also ([1978VO03](#)).

The absorption cross section has been studied in the range  $E_\gamma \approx 100$  to 340 MeV; it shows a broad bump centered at  $\approx 125$  MeV and a fairly smooth increase to a maximum at  $\approx 320$  MeV ([1979AH1A](#), [1979ZI1A](#)). For spallation studies see ([1978VO03](#):  $(\gamma, \text{n}2\text{p})$ ,  $(\gamma, \text{pd})$ ) and ([1974AJ01](#)). For pion production see ([1979AJ01](#)),  ${}^6\text{He}$  and ([1979EP02](#), [1982DO12](#)). For references to the earlier work see ([1979AJ01](#)). See also ([1979DE2A](#), [1980AH1A](#)) and ([1979LE1A](#), [1979TA1C](#), [1980KU06](#), [1981DZ01](#), [1981IS11](#), [1981SU1H](#), [1982HO05](#), [1982LO04](#), [1982LO06](#), [1983BU1F](#); theor.).

### 11. ${}^6\text{Li}(\gamma, \gamma){}^6\text{Li}$

The width,  $\Gamma_\gamma$ , of  ${}^6\text{Li}^*(3.56) = 8.1 \pm 0.5$  eV: see ([1974AJ01](#)) and Table 6.4 in ([1979AJ01](#));  $E_x = 3562.88 \pm 0.10$  keV ([1981RO02](#)).

|  |                 |
|--|-----------------|
| 12. (a) ${}^6\text{Li}(\text{e}, \text{e}){}^6\text{Li}$ |                 |
| (b) ${}^6\text{Li}(\text{e}, \text{ep}){}^5\text{He}$    | $Q_m = -4.59$   |
| (c) ${}^6\text{Li}(\text{e}, \text{ed}){}^4\text{He}$    | $Q_m = -1.4735$ |

The elastic scattering has been studied for  $E_e = 85$  to 600 MeV [see ([1974AJ01](#), [1979AJ01](#))] and at  $E_e = 80.0$  to 297.8 MeV ([1982BE11](#)). The latter find that the results appear to require that the ground state be viewed as an  $\alpha$ -d cluster in which the deuteron cluster is deformed and aligned.

Table 6.4: Levels of  ${}^6\text{Li}$  from  ${}^6\text{Li}(\text{e}, \text{e}')$  and  ${}^6\text{Li}(\gamma, \gamma')$ <sup>a</sup>

| $E_x$ (MeV)                    | $J^\pi; T$ | $\Gamma_{\gamma_0}$ (eV)         | Multipolarity |
|--------------------------------|------------|----------------------------------|---------------|
| $2.183 \pm 0.009$ <sup>b</sup> | $3^+; 0$   | $(4.40 \pm 0.34) \times 10^{-4}$ | E2            |
| $3.563 \pm 0.010$              | $0^+; 1$   | $8.19 \pm 0.17$ <sup>c</sup>     | M1            |
| $4.27 \pm 0.04$                | $2^+; 0$   | $(5.4 \pm 2.8) \times 10^{-3}$   | E2            |
| $5.379 \pm 17$ <sup>c, d</sup> | $2^+; 1$   | $0.27 \pm 0.05$ <sup>e</sup>     | M1            |

<sup>a</sup> See Table 6.4 in ([1979AJ01](#)) for references and for the earlier work.

<sup>b</sup>  $B(\text{E2}) \uparrow = 21.8 \pm 4.8 \text{ e}^2 \cdot \text{fm}^4$ ; see Fig. 10 in ([1974YE01](#)).

<sup>c</sup> Weighted mean of values shown in Table 6.4 in ([1979AJ01](#)).

<sup>d</sup>  $\Gamma = 540 \pm 20 \text{ keV}$ ; see ([1979AJ01](#)).

<sup>e</sup> ([1980BE20](#)). See also ([1979AJ01](#)).

The ground-state M1 current density has also been calculated ([1982BE11](#)). A model-independent analysis of the elastic scattering yields  $r_{\text{rms}} = 2.51 \pm 0.10 \text{ fm}$ .

Table 6.4 summarizes the results obtained in the inelastic scattering of electrons. Form factors have been measured for  ${}^6\text{Li}^*(2.19)$  ( $E_e = 140.5$  to  $278.2 \text{ MeV}$ ),  ${}^6\text{Li}^*(3.56)$  ( $E_e = 140.5$  to  $330.7 \text{ MeV}$ ) and  ${}^6\text{Li}^*(5.37)$  ( $E_e = 76$  to  $278.2 \text{ MeV}$ ) ([1979BE38](#), [1980BE20](#)). The transition current density for  ${}^6\text{Li}^*(3.56)$  has been calculated by ([1979BE38](#)). ([1980BE28](#)) have measured the form factor of the ( $t$ ,  ${}^3\text{He}$ ) continuum up to  $4 \text{ MeV}$  above threshold at  $E_e = 102$  and  $123 \text{ MeV}$ : no narrow structures corresponding to  ${}^6\text{Li}$  states are observed. The radiative capture cross section is in good accord with the  $t$ - ${}^3\text{He}$  cluster model with a spectroscopic factor  $\theta_0^2 = 0.67$  ([1980BE28](#)). Quasi-elastic processes have been studied by ([1978KU06](#):  $250 \rightarrow 580 \text{ MeV}/c$ ). At  $E_e = 700 \text{ MeV}$  the proton separation spectra (reaction (b)) are similar to those observed in ( $p, 2p$ ) ([1978NA05](#)). For reaction (c) see ([1979AJ01](#)). For  $\pi^+$  production see  ${}^6\text{He}$ . The cross section for inelastic scattering has been measured at  $E_e = 1.28 \text{ GeV}$  by ([1981ES1B](#); prelim.).

For the earlier work, and for references, see ([1979AJ01](#)). See also ([1979DO1A](#), [1979DO1C](#), [1979TI1A](#), [1979WA1D](#), [1980DR1B](#), [1982PE06](#), [1983MO1F](#)) and ([1978BA1C](#), [1979BE1G](#), [1979BE39](#), [1979BU1A](#), [1979CA06](#), [1979FR1B](#), [1979FR1C](#), [1979GL10](#), [1979NA1C](#), [1979SA39](#), [1980BU10](#), [1980HO26](#), [1980PA06](#), [1981BU04](#), [1981DE1T](#), [1981KU13](#), [1981LA1E](#), [1981LO07](#), [1981SU1H](#), [1982BO31](#), [1982KA24](#), [1982RE1F](#), [1982SA16](#), [1982VO01](#), [1983KR05](#); theor.).

### 13. ${}^6\text{Li}(\pi^\pm, \pi^\pm){}^6\text{Li}$ (See also the “GENERAL” section here.)

An elastic angular distribution has been measured at  $E_{\pi^\pm} \approx 50 \text{ MeV}$  and compared with that for  ${}^7\text{Li}(\pi^+, \pi^+)$ : see  ${}^7\text{Li}$  ([1978DY01](#)). For a study of inclusive reactions at  $E_{\pi^\pm} = 100, 160, 220 \text{ MeV}$ , see ([1981MC09](#)).

14. (a)  ${}^6\text{Li}(\text{n}, \text{n}'){}^6\text{Li}^*$   
 (b)  ${}^6\text{Li}(\text{n}, \text{nd}){}^4\text{He}$        $Q_m = -1.4753$   
 (c)  ${}^6\text{Li}(\text{n}, \text{nt}){}^3\text{He}$        $Q_m = -15.7958$

Angular distributions have been reported for  $\text{n}_0$  at  $E_n = 1.0$  to 14.2 MeV and for  $\text{n}_1$  at  $E_n = 7.5$  to 14.1 MeV: see (1979AJ01). Recent measurements are reported at  $E_n = 1.5$  to 4.0 MeV (1982SM02;  $\text{n}_0$ ), 4.0 to 7.5 MeV (1979KN01;  $\text{n}_0$ ), 7.47 to 13.94 MeV (1979HO11;  $\text{n}_0, \text{n}_1$ ) and 14.6 MeV (1980MI02;  $\text{n}_0$ ). For reaction (b) see (1978RI02;  $E_n = 800$  MeV). See also (1977HA1E, 1977KN1A, 1981DAZZ) and (1981KO1M, 1982KO1U, 1982LA16, 1982LE10, 1982VO1B, 1983FU06, 1983GU1F; theor.) and  ${}^7\text{Li}$ .

15. (a)  ${}^6\text{Li}(\text{p}, \text{p}){}^6\text{Li}$   
 (b)  ${}^6\text{Li}(\text{p}, 2\text{p}){}^5\text{He}$        $Q_m = -4.59$   
 (c)  ${}^6\text{Li}(\text{p}, \text{pd}){}^4\text{He}$        $Q_m = -1.4753$   
 (d)  ${}^6\text{Li}(\text{p}, \text{p}^3\text{H}){}^3\text{He}$        $Q_m = -15.7958$   
 (e)  ${}^6\text{Li}(\text{p}, \text{pn}){}^5\text{Li}$        $Q_m = -5.66$   
 (f)  ${}^6\text{Li}(\text{p}, 2\text{d}){}^3\text{He}$        $Q_m = -19.8285$   
 (g)  ${}^6\text{Li}(\text{p}, 3\text{p}){}^4\text{H}$        $Q_m = -26.1$   
 (h)  ${}^6\text{Li}(\text{p}, \text{nd}){}^4\text{Li}$        $Q_m = -25.0$

Proton angular distributions have been measured at  $E_p = 0.5$  to 600 MeV [see (1974AJ01, 1966LA04)] and at  $E_p = 24.4$  MeV (1982PE06;  $p_0, p_1, p_2$ ), 136 MeV (1981HE21;  $p_0, p_1, p_2$ ), 144 MeV (1980MO01;  $p_0$ ) and 800 MeV (1979MO1E;  $p_3$ ). For a summary of the results on excited states see Table 6.5. At  $E_p = 31$  and 32 MeV the spin-flip probabilities for  ${}^6\text{Li}^*(2.19, 3.56)$  have been determined by (1981CO08). The cross-section data at  $E_p \approx 25$  and 50 MeV have been reviewed by (1982PE06): some difficulties are encountered in describing the cross section for populating  ${}^6\text{Li}^*(3.56)$ . For reaction (b) at  $E_p = 47$  and 70 MeV see (1983VD03) and at 800 MeV see (1980CH05, 1981FR24). See also  ${}^5\text{He}$  and (1979AJ01).

Reaction (c) has been studied at  $E_p = 9$  MeV to 1 GeV [see (1974AJ01, 1979AJ01)] and at  $E_p = 600$  MeV (1978LA11) and 670 MeV (1980AL10). At  $E_p = 100$  MeV the agreement with DWIA is good:  $S_\alpha = 0.58 \pm 0.02$  (1977RO02). A study of reaction (f) indicates dominance, at  $E_p = 100$  MeV, of the direct quasi-free reaction process ( $\text{p} + \alpha \rightarrow \text{d} + {}^3\text{He}$ ):  $S_\alpha = 0.52 \pm 0.03$  (1977CO07). See also (1982ER06;  $E_p = 670$  MeV).

(1975VO04) have compared yields from reactions (b), (c) and (e): by comparing yields in the isospin allowed and forbidden (reaction (c)) channels, they set an upper limit of  $\alpha^2 \leq 8 \times 10^{-3}$  for a possible  $T = 0$  admixture in the  $T = 1$  state,  ${}^6\text{Li}^*(5.37)$ . Reaction (e), at  $E_p = 47$  MeV, may proceed by sequential decay involving  ${}^6\text{Li}^*(21, 30)$  or states in  ${}^6\text{Be}$  [see reaction 3 in  ${}^6\text{Be}$ ] (1977WA05). Reaction (d), studied at  $E_p = 100$  MeV, and compared with the  $(\text{p}, \text{p}\alpha)$

reaction indicates that the  ${}^3\text{He} + \text{t}$  parentage of  ${}^6\text{Li}$  is comparable with the  $\alpha + \text{d}$  parentage: the quantitative estimates depend strongly on the wave functions used in the estimate ([1976RO02](#)). See also ([1974AJ01](#)) for the earlier work.

For reaction (g) see ([1979NA14](#);  $E_{\text{p}} = 640$  MeV). For reaction (h) see ([1979AL11](#);  $E_{\text{p}} = 670$  MeV). See also  ${}^7\text{Be}$ , ([1979BA28](#), [1981PA25](#)), ([1978CH1C](#), [1982YA1A](#), [1983MO1F](#)) and ([1978BA1C](#), [1978GO1B](#), [1978PL1A](#), [1979AH04](#), [1979CH1A](#), [1979KH01](#), [1979KO1C](#), [1979YA1B](#), [1980BA04](#), [1980BO12](#), [1980MU1E](#), [1981CH1J](#), [1981FE04](#), [1981GU1F](#), [1981SM1B](#), [1981VE07](#), [1981ZH1D](#), [1982GO1G](#), [1982GO1H](#), [1982GO1J](#), [1982JI1A](#), [1982LE08](#), [1982ZH1J](#), [1983GO1U](#); theor.).

|         |   |                 |
|---------|---|-----------------|
| 16. (a) | ${}^6\text{Li}(\text{d}, \text{d}') {}^6\text{Li}^*$    |                 |
| (b)     | ${}^6\text{Li}(\text{d}, \text{pn}) {}^6\text{Li}$      | $Q_m = -2.2246$ |
| (c)     | ${}^6\text{Li}(\text{d}, 2\text{d}) {}^4\text{He}$      | $Q_m = -1.4753$ |
| (d)     | ${}^6\text{Li}(\text{d}, \alpha\text{p}) {}^3\text{H}$  | $Q_m = 2.5574$  |
| (e)     | ${}^6\text{Li}(\text{d}, \alpha\text{n}) {}^3\text{He}$ | $Q_m = 1.7936$  |

Angular distributions of deuterons have been measured at  $E_{\text{d}} = 4.5$  to 19.6 MeV: see ([1979AJ01](#)). The  $T = 1, 0^+$  state,  ${}^6\text{Li}^*(3.56)$  is not appreciably populated. For a summary of the results on excited states see Table [6.5](#).

At  $E_{\text{d}} = 21$  MeV reaction (b) shows spectral peaking (characteristic of  ${}^1S_0$  for the pn system [ $T = 1$ ]) when  ${}^6\text{Li}^*(3.56)$  is formed, in contrast with the much broader shape (characteristic of  ${}^3S_1$ ) seen when  ${}^6\text{Li}^*(0, 2.19)$  are populated. A study of reaction (c) at  $E_{\text{d}} = 52$  MeV shows that the  $\alpha$ -clustering probability,  $N_{\text{eff}} = 0.12^{+0.12}_{-0.06}$  if a Hankel function is used ([1973HA31](#)) [see this reference also for a discussion of other results on momentum distributions and  $\alpha$ -clustering probability in  ${}^6\text{Li}$ ]. The  $\alpha$ -particle and the deuteron clusters in  ${}^6\text{Li}$  have essentially a relative orbital momentum of  $l = 0$ . The D-state probability of the ground state of  ${}^6\text{Li}$  is  $\approx 5\%$  of the S-state ([1973HA31](#)). Quasi-free scattering is an important process even for  $E_{\text{d}} = 6$  to 11 MeV. Interference effects are evident in reaction (c) proceeding through  ${}^6\text{Li}^*(2.19, 4.31)$ : this is due to the experimental being unable to determine whether the detected particle was emitted first or second in the sequential decay. Reactions (c) and (d) studied at  $E_{\text{d}} = 7.5$  to 10.5 MeV indicate that the three-body breakup of  ${}^6\text{Li}$  at these low energies is dominated by sequential decay processes. See ([1979AJ01](#)) for references. For pion production see ([1978PE12](#)). See also ([1980KI1D](#)) and ([1979YA1B](#), [1980LE07](#), [1982JI1A](#), [1982LE10](#), [1983GO1U](#); theor.).

## 17. ${}^6\text{Li}(\text{t}, \text{t}') {}^6\text{Li}^*$

At  $E_{\text{t}} = 17$  MeV angular distributions have been measured for the tritons to  ${}^6\text{Li}^*(0, 3.56)$  ([1976SH14](#)).

Table 6.5: Parameters of levels of  ${}^6\text{Li}$  <sup>a</sup>

| $E_x$ (MeV $\pm$ keV)       | $\Gamma_{\text{c.m.}}$ (keV)      | Reactions   |

18. (a)  ${}^6\text{Li}({}^3\text{He}, {}^3\text{He}){}^6\text{Li}$   
(b)  ${}^6\text{Li}({}^3\text{He}, \text{t}){}^3\text{He}{}^3\text{He}$        $Q_m = -15.7958$   
(c)  ${}^6\text{Li}({}^3\text{He}, \text{p}\alpha){}^4\text{He}$        $Q_m = 16.8779$

Angular distributions have been measured at  $E({}^3\text{He}) = 8$  to 217 MeV [see (1979AJ01)] and at  $E({}^3\vec{\text{He}}) = 33.3$  (1981BA37; to  ${}^6\text{Li}^*(0, 2.19)$ ) and  $E({}^3\text{He}) = 44.04$  MeV (1979GO07; to  ${}^6\text{Li}_{\text{g.s.}}$ ). For polarization measurements see  ${}^9\text{B}$ . For reaction (b) at  $E({}^3\text{He}) = 45$  MeV see (1977HA19). For reaction (c) at  $E({}^3\text{He}) = 2.9$  MeV see (1979BA66). For pion production see (1982PI1C). See also (1979KA1G) and (1979BA1H, 1980LE06, 1982LE10; theor.).

19. (a)  ${}^6\text{Li}(\alpha, \alpha'){}^6\text{Li}^*$   
(b)  ${}^6\text{Li}(\alpha, 2\alpha){}^2\text{H}$        $Q_m = -1.4753$   
(c)  ${}^6\text{Li}(\alpha, \alpha\text{p}){}^5\text{He}$        $Q_m = -4.59$

Angular distributions (reaction (a)) have been measured at  $E_\alpha = 3.0$  to 166 MeV [see (1974AJ01, 1979AJ01)] and at  $E_\alpha = 1.39$  to 2.98 MeV (1981HE05;  $\alpha_0$ ),  $E({}^6\vec{\text{Li}}) = 15.1$  to 22.7 MeV (1979EG01;  ${}^6\text{Li}_{\text{g.s.}}$ ) and  $E_\alpha = 59$  MeV (1979FO21;  $\alpha_0$ ). For yield and polarization measurements see  ${}^{10}\text{B}$ .

Reaction (b) has been studied at  $E_\alpha = 23.6$  to 79.6 MeV [see (1974AJ01, 1979AJ01)] and at  $E_\alpha = 6.6$  to 13.0 MeV (1983GO07), 18 MeV (1980ZH1A) and 700 MeV (1979DO04). Using a width parameter of 60.6 MeV/c, (1979DO04) find that the effective number of  $\alpha + \text{d}$  clusters for  ${}^6\text{Li}_{\text{g.s.}}$ ,  $n_{\text{eff}} = 0.98 \pm 0.05$ ; the results are very model dependent. See also (1980KI1D), (1979AJ01) and  ${}^8\text{Be}$ . For reaction (c) see  ${}^5\text{He}$  (1979NA06). For pion production see (1978PE12, 1982AN1H). See also (1978CH1C) and (1978AN20, 1979SU06, 1979SU09, 1979SU1F, 1980HA1P, 1981BA20, 1981LA13, 1982JI1A, 1982LE10; theor.).

20. (a)  ${}^6\text{Li}({}^6\text{Li}, {}^6\text{Li}){}^6\text{Li}$   
(b)  ${}^6\text{Li}({}^6\text{Li}, 2\text{d}){}^4\text{He}{}^4\text{He}$        $Q_m = -2.9507$

Angular distributions of  ${}^6\text{Li}$  ions have been studied for  $E({}^6\text{Li})$  = 3.2 to 36 MeV [see ([1974AJ01](#), [1979AJ01](#))] and at  $E({}^6\vec{\text{Li}})$  = 20 MeV ([1981AV1B](#); to  ${}^6\text{Li}^*(0, 2.19)$ ). At  $E({}^6\text{Li})$  = 32 and 36 MeV the ratios for populating  ${}^6\text{Li}^*(3.56)$  and  ${}^6\text{He}_{\text{g.s.}} + {}^6\text{Be}_{\text{g.s.}}$  [the analog states] vary with angle: see reaction 10 in  ${}^6\text{He}$ . Reaction (b) has been studied for  $E({}^6\text{Li})$  = 36 to 47 MeV: enhancements in yield, due to double spectator poles, have been observed in d-d and  $\alpha - \alpha$  but not in  $\alpha$ -d double coincidence spectra. The widths of the peaks are smaller than those predicted from the momentum distribution of  $\alpha + d$  clusters in  ${}^6\text{Li}$ . Reaction (b) also proceeds via  ${}^6\text{Li}^*(2.19)$  ([1979WA13](#), [1981WA15](#), [1982WA07](#)). See also  ${}^8\text{Be}$ .

See also ([1981NO06](#), [1982LA19](#)), ([1981HE02](#), [1981DY02](#); theor.) and  ${}^{12}\text{C}$  in ([1980AJ01](#), [1985AJ01](#)).

## 21. ${}^6\text{Li}({}^7\text{Li}, {}^7\text{Li}){}^6\text{Li}$

See ([1981GU1B](#); theor.).

## 22. ${}^6\text{Li}({}^9\text{Be}, {}^9\text{Be}){}^6\text{Li}$

The elastic scattering has been studied at  $E({}^6\text{Li})$  = 4.0, 6.0 and 24 MeV: see ([1979AJ01](#)).

## 23. ${}^6\text{Li}({}^{10}\text{B}, {}^{10}\text{B}){}^6\text{Li}$

The elastic scattering has been studied at  $E({}^6\text{Li})$  = 5.8 and 30 MeV: see ([1979AJ01](#)).

## 24. (a) ${}^6\text{Li}({}^{12}\text{C}, {}^{12}\text{C}){}^6\text{Li}$ (b) ${}^6\text{Li}({}^{13}\text{C}, {}^{13}\text{C}){}^6\text{Li}$

The elastic scattering (reaction (a)) has been studied at  $E({}^6\text{Li})$  = 4.5 to 100 MeV [see ([1975AJ02](#), [1980AJ01](#))] and at  $E({}^6\text{Li})$  = 36 MeV ([1982WO09](#); also to  ${}^{12}\text{C}^*(4.4)$ ), 90 MeV ([1981GL03](#)), 99 MeV ([1981SC16](#)) and 156 MeV [see ([1982CO19](#)) and ([1982MA21](#), [1982MI1D](#))]. See also ([1979FUZS](#), [1982AS1B](#), [1982TA23](#)). For fusion cross sections see ([1982DE30](#)). The elastic scattering (reaction (b)) has been studied for  $E({}^7\text{Li})$  = 5.8 to 34 MeV [see ([1979AJ01](#), [1981AJ01](#))] and at 40 MeV ([1979ZE01](#)). For fusion cross sections see ([1982DE30](#)). See also  ${}^{18}\text{F}$  and  ${}^{19}\text{F}$  in ([1983AJ01](#)), ([1978HO1C](#), [1978MA1B](#), [1982TA23](#)) and ([1979BE59](#), [1979SU1F](#), [1980ST22](#), [1981GR17](#), [1981GU1B](#), [1981ME1E](#), [1981OS1D](#), [1981TH07](#), [1982DE28](#), [1982DR1D](#), [1982KO1Z](#), [1982MA21](#), [1982MA35](#), [1982RA22](#); theor.).

See ([1981AJ01](#)).

Elastic angular distributions have been measured at  $E({}^6\text{Li}) = 4.5$  to  $50.6$  MeV and at  $E({}^{16}\text{O}) = 36$  MeV [see ([1979AJ01](#), [1982AJ01](#))] as well as at  $E({}^6\text{Li}) = 32$  MeV ([1980AN16](#)) and  $36$  MeV ([1982WO09](#)). See also ([1978HO1C](#)) and ([1981ME1E](#), [1982AL02](#), [1982RA22](#); theor.).

27. (a)  ${}^6\text{Li}({}^{24}\text{Mg}, {}^{24}\text{Mg}){}^6\text{Li}$   
(b)  ${}^6\text{Li}({}^{25}\text{Mg}, {}^{25}\text{Mg}){}^6\text{Li}$   
(c)  ${}^6\text{Li}({}^{26}\text{Mg}, {}^{26}\text{Mg}){}^6\text{Li}$

The elastic scattering has been studied at  $E({}^6\text{Li}) = 87.8$  MeV ([1981FU04](#)), and at  $36$  MeV ([1982WO09](#); reaction (c)). See also ([1981CO06](#), [1982CO18](#), [1982KO1Z](#); theor.).

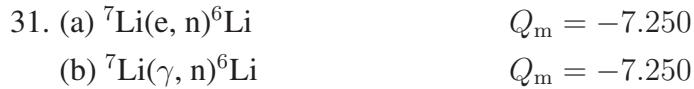

The elastic scattering has been studied at  $E({}^6\text{Li}) = 88$  MeV ([1981FU04](#)). See also ([1982TA23](#)) and ([1980CO11](#), [1982KO1Z](#); theor.).

The elastic scattering has been studied at  $E({}^6\text{Li}) = 13, 20$  and  $25$  MeV ([1981HU08](#)),  $27$  and  $34$  MeV ([1983VIZZ](#)),  $32$  MeV ([1980AN16](#)),  $60, 75$  and  $90$  MeV ([1981GL03](#)),  $99$  MeV ([1981SC16](#)) and  $154$  MeV ([1980SC12](#)). At  $E({}^6\text{Li}) = 156$  MeV the inelastic scattering of  ${}^6\text{Li}$  ions proceeds predominantly via direct one-nucleon removal ([1981NI06](#)). See also ([1979AJ01](#), [1980ZI02](#)) and ([1979SA1E](#), [1980HI1B](#), [1980HU09](#), [1980ST22](#), [1981HU07](#), [1981ME1E](#), [1981PH1A](#), [1982BR1D](#), [1982CO02](#), [1982CO18](#), [1982KU05](#), [1982SA16](#); theor.).

30. (a)  ${}^6\text{Li}({}^{39}\text{K}, {}^{39}\text{K}){}^6\text{Li}$   
(b)  ${}^6\text{Li}({}^{40}\text{Ca}, {}^{40}\text{Ca}){}^6\text{Li}$   
(c)  ${}^6\text{Li}({}^{44}\text{Ca}, {}^{44}\text{Ca}){}^6\text{Li}$   
(d)  ${}^6\text{Li}({}^{48}\text{Ca}, {}^{48}\text{Ca}){}^6\text{Li}$

Elastic scattering has been studied at  $E(^6\text{Li}) = 26$  and  $30$  MeV for reaction (b) ([1982CO12](#)),  $28$  and  $34$  MeV for reactions (a) ([1981SZ02](#)), (b) and (d) ([1977CU02](#)), at  $88$  MeV for reactions (b) and (c) ([1981FU04](#)) and at  $99$  MeV for reaction (b) ([1981SC16](#)). See also ([1980JA1C](#), [1982CO18](#), [1982KO1Z](#), [1982KU05](#), [1982SA16](#); theor.).

Reaction (a) has been studied by ([1980AS02](#)) at  $E_e = 108, 163$  and  $198$  MeV: equivalent ( $\gamma, \text{n}$ ) cross sections are derived for  $E_x \approx 70$  to  $120$  MeV. Transitions to  ${}^6\text{Li}^*(0, 2.19, 3.56)$  have been observed in reaction (b): see ([1979AJ01](#)) and ([1978DE13](#)). See also  ${}^7\text{Li}$ .

Differential cross sections have been measured at  $E_\pi = 75$  and  $175$  MeV for the transition to  ${}^6\text{Li}^*(0, 2.19)$  ([1980KA11](#)).

See ([1980MI02](#)). See also  ${}^8\text{Li}$ .

Angular distributions of deuterons (reaction (a)) have been studied for  $E_p = 16.7$  to  $185$  MeV [see ([1979AJ01](#))], at  $E_p = 18.6$  MeV ([1983BEYY](#);  $p_0$ ),  $200$  and  $400$  MeV ([1981LI1B](#); prelim.),  $530$  MeV ([1981IR1A](#); prelim.) and at  $E_p = 800$  MeV ([1980BA02](#);  $d_0, d_1$ ). A DWBA analysis of the  $185$  MeV data leads to  $C^2S = 0.87, 0.67, 0.24, (0.05), 0.14$ , respectively for  ${}^6\text{Li}^*(0, 2.19, 3.56, 4.31, 5.37)$ . No other states were seen below  $E_x \approx 20$  MeV ([1976FA03](#)). At  $E_p = 800$  MeV  ${}^6\text{Li}^*(2.19)$  is populated much more strongly than  ${}^6\text{Li}_{\text{g.s.}}$  and the angular distribution of  $d_1$  is not reproduced by FRDWBA ([1980BA02](#)). For reaction (b) see ([1977WA05](#)). See also  ${}^8\text{Be}$ , ([1979AJ01](#)) and ([1983FO01](#); theor.).

A study at  $E_d = 23.6$  MeV of the relative cross sections of the analog reactions  ${}^7\text{Li}(\text{d}, \text{t}){}^6\text{Li}$  (to the first two  $T = 1$  states at 3.56 and 5.37 MeV) and  ${}^7\text{Li}(\text{d}, {}^3\text{He}){}^6\text{He}$  (to the ground and 1.80 MeV excited states) shows that  ${}^6\text{Li}^*(3.56, 5.37)$  have high isospin purity ( $\alpha^2 < 0.008$ ): this is explained in terms of antisymmetrization effects which prevent mixing with nearby  $T = 0$  states (1971DE08). See also (1974AJ01) and (1979DO19; theor.).

|   |                |
|---|----------------|
| 36. (a) ${}^7\text{Li}({}^3\text{He}, \alpha){}^6\text{Li}$     | $Q_m = 13.328$ |
| (b) ${}^7\text{Li}({}^3\text{He}, \text{d}\alpha){}^4\text{He}$ | $Q_m = 11.852$ |

Angular distributions have been reported at  $E({}^3\text{He}) = 5.1$  to 18 MeV [see (1974AJ01)] and at  $E({}^3\text{He}) = 0.6$  to 2.5 MeV (1979LIZT, 1980LI1D, 1980LI1F; prelim.;  $\alpha$  to  ${}^6\text{Li}^*(0, 2.19, 3.56, 5.37)$ ) and  $E({}^3\vec{\text{He}}) = 33.3$  MeV (1981BA38;  $\alpha_0, \alpha_1, \alpha_2$ ). Excited states observed in this reaction are displayed in Table 6.5. No other states are reported below  $E_x = 10$  MeV: see (1979AJ01). See also  ${}^{10}\text{B}$ .

Several attempts have been made to look at the isospin decay of  ${}^6\text{Li}^*(5.37)$  [ $J^\pi; T = 2^+; 1$ ] via  ${}^7\text{Li}({}^3\text{He}, \alpha){}^6\text{Li}^* \rightarrow \text{d} + \alpha$ : the branching is  $< 1\%$ .  $\Gamma_p/\Gamma = 0.35 \pm 0.10$  and  $\Gamma_{p+n}/\Gamma = 0.65 \pm 0.10$  for  ${}^6\text{Li}^*(5.37)$ : see (1979AJ01).  ${}^4\text{He} + \text{d}$  spectra suggest the excitation of  ${}^6\text{Li}^*(4.3)$  [ $E_x = 4.3 \pm 0.2$  MeV,  $\Gamma = 1.6 \pm 0.3$  MeV] (1983AR05) and  ${}^6\text{Li}^*(5.7)$  [ $E_x = 5.65 \pm 0.2$  MeV,  $\Gamma = 1.65 \pm 0.3$  MeV] (1982AR08;  $E({}^3\text{He}) = 2.5$  and 5 MeV).

|   |               |
|---|---------------|
| 37. (a) ${}^9\text{Be}(\text{p}, \alpha){}^6\text{Li}$            | $Q_m = 2.126$ |
| (b) ${}^9\text{Be}(\text{p}, \text{d}){}^4\text{He}{}^4\text{He}$ | $Q_m = 0.651$ |

Angular distributions of  $\alpha$ -particles (reaction (a)) have been measured at  $E_p = 0.11$  to 45 MeV: see (1974AJ01, 1979AJ01).  ${}^6\text{Li}^*(2.19, 4.31, 5.37, 5.65)$  are populated at  $E_p = 30$  and 50 MeV (1983DE15). See also Table 6.5 and (1981DE1X).  ${}^6\text{Li}^*(3.56)$  decays by  $\gamma$ -emission consistent with M1;  $\Gamma_\alpha/\Gamma < 0.025$  [forbidden by spin and parity conservation] [see (1981AR08) for a discussion of a possible experiment to study this problem]. At  $E_p = 9$  MeV the yield of reaction (b) is dominated by FSU through  ${}^8\text{Be}^*(0, 2.9)$  and  ${}^6\text{Li}^*(2.19)$  with little or no yield from direct three-body decay: see (1979AJ01). For a study of the continuum see (1983DE14). See also  ${}^{10}\text{B}$ .

|   |                |
|---|----------------|
| 38. ${}^9\text{Be}(\text{t}, {}^6\text{He}){}^6\text{Li}$ | $Q_m = -5.380$ |
|---|----------------|

Angular distributions of  ${}^6\text{He}_{\text{g.s.}} + {}^6\text{Li}_{\text{g.s.}}$ ,  ${}^6\text{Li}_{\text{g.s.}} + {}^6\text{He}_{\text{g.s.}}$ ,  ${}^6\text{Li}_{3.56}^* + {}^6\text{He}_{\text{g.s.}}$ , and  ${}^6\text{He}_{\text{g.s.}} + {}^6\text{Li}_{3.56}^*$  [the second listed ion being the detected one] have been measured at  $E_t = 21.5$  and 23.5 MeV. In the latter two cases the final state is composed of two isobaric analog states: angular distributions

are symmetric about  $90^\circ_{\text{cm}}$ , within the overall experimental errors. In the reaction leading to the ground states of  ${}^6\text{He}$  and  ${}^6\text{Li}$  differences from symmetry of as much as 40% are observed at forward angles. Angular distributions involving  ${}^6\text{He}_{\text{g.s.}} + {}^6\text{Li}^*(2.19)$  and  ${}^6\text{Li}_{\text{g.s.}} + {}^6\text{He}^*(1.8)$  have also been measured. This reaction appears to proceed predominantly by means of the direct pickup of a triton or  ${}^3\text{He}$  from  ${}^9\text{Be}$  ([1975VO08](#)). Differential cross sections are also reported at  $E_t = 17$  MeV ([1979FL03](#)). See also  ${}^{12}\text{B}$  in ([1980AJ01](#)) and ([1983WE02](#); theor.).

Angular distributions of  ${}^6\text{Li}$  ions have been obtained at  $E({}^3\text{He}) = 6$  to 10 MeV: see ([1974AJ01](#)). The continuum has been studied by ([1983DE14](#)) at  $E({}^3\text{He}) = 45$  MeV: subtraction of the phase space contribution suggests the population of  ${}^6\text{Li}$  states at  $E_x = 8 - 12$ ,  $\approx 21$  and 21.5 MeV. See also ([1981DE1X](#)).

Angular distributions of the  ${}^6\text{Li}$  ions to  ${}^6\text{Li}^*(0, 2.19)$  have been measured at  $E_d = 13.6$  MeV ([1982DO1E](#)) and 19.5 MeV ([1971GU07](#)).

Angular distributions of the  ${}^7\text{Be}$  ions [ ${}^7\text{Be}^*(0, 0.43)$ ] corresponding to formation of  ${}^6\text{Li}^*(0, 2.19)$  have been measured at  $E({}^3\text{He}) = 30$  MeV: see ([1974AJ01](#)).

At  $E_\alpha = 72.5$  MeV only  ${}^6\text{Li}^*(0, 2.18 \pm 0.03)$  are observed: the latter is excited much more strongly than is the ground state ( $S_\alpha$  for the ground state is 0.4 that for  ${}^6\text{Li}^*(2.19)$ ). The angular distributions for both transitions are flat ([1976WO11](#)). Angular distributions are also reported at  $E_\alpha = 27.2$  MeV to  ${}^8\text{Be}^*(0, 2.9)$  and  ${}^6\text{Li}_{\text{g.s.}}$  ([1982DO1F](#)). See also ([1981DEZX](#)).

See ([1980HO14](#); theor.).

Angular distributions of  $^6\text{Li}$  ions are reported at  $E_d = 13.6$  MeV ([1983DOZY](#)), 19.5 MeV ([1971GU07](#)) for transitions to  $^7\text{Li}^*(0, 0.48)$ . See also ([1974AJ01](#)).

Angular distributions of  $^6\text{Li}$  ions are reported at  $E(^3\text{He}) = 3.0$  and 5.2 MeV. The reaction has been observed to lead to  $^8\text{Be}^*(2.9) + ^6\text{Li}(0)$  and to  $^8\text{Be}(0) + ^6\text{Li}^*(3.56)$ . It is suggested that  $^6\text{Li}^*(3.56)$  contains a far smaller admixture of the  $(^3\text{He} + \text{t})$  configuration than does  $^6\text{Li}(0)$ : see ([1974AJ01](#)).

See ([1982DO1G](#)) and  $^{12}\text{C}$  in ([1985AJ01](#)).

Angular distributions of the  $^6\text{Li}$  ions corresponding to the transition to  $^7\text{Be}^*(0+0.43)$  have been measured at five energies in the range  $E_p = 36.0$  to 56.8 MeV and the data have been analyzed using ZR and FRDWBA assuming the pickup of  $^5\text{He}$  and  $^6\text{Li}$  clusters as the dominant mechanism: see ([1974AJ01](#), [1979AJ01](#)). See also ([1979HA52](#); theor.).

Angular distributions of  $^6\text{Li}$  ions are reported at  $E_d = 19.5$  and 51.8 MeV: see ([1974AJ01](#)). See also  $^8\text{Be}$ .

Angular distributions of  $^6\text{Li}$  have been obtained at  $E(^3\text{He}) = 28$  to 40.7 MeV: see ([1974AJ01](#)).

Angular distributions (reaction (a)) have been obtained at  $E_\alpha = 42$  MeV involving  ${}^6\text{Li}^*(0, 2.19)$ : see ([1974AJ01](#)). At  $E_\alpha = 65$  MeV reaction (b) goes via  ${}^6\text{Li}^*(2.19, 4.31)$  ([1978SA26](#)). See also  ${}^{10}\text{B}$ .

At  $E({}^{10}\text{B}) = 68$  MeV transitions to  ${}^6\text{Li}^*(2.19)$  and to a number of states of  ${}^{16}\text{O}$  are observed by ([1981BI07](#)). See also  ${}^{16}\text{O}$  in ([1982AJ01](#)).

At  $E_p = 45$  MeV, the angular distribution of the  ${}^6\text{Li}$  ions corresponding to  ${}^8\text{Be}^*(0, 2.9)$  have been measured: see ([1974AJ01](#)).

See ([1980AJ01](#)).

See ([1981AJ01](#)).

See ([1981AJ01](#)).

Angular distributions have been measured at  $E({}^3\text{He}) = 11$  to  $40.7$  MeV involving  ${}^6\text{Li}^*(0, 3.56)$  and various states of  ${}^{16}\text{O}$ : see ([1974AJ01](#), [1977AJ02](#)).

Table 6.6: Energy levels of  $^6\text{Be}$

| $E_x$ (MeV $\pm$ keV)    | $J^\pi; T$ | $\Gamma_{\text{c.m.}}$ | Decay                 | Reactions  |
|--------------------------|------------|------------------------|-----------------------|------------|
| g.s.                     | $0^+; 1$   | $92 \pm 6$ keV         | $p, \alpha$           | 2, 3, 4, 5 |
| $1.67 \pm 50^{\text{a}}$ | $(2)^+; 1$ | $1.16 \pm 0.06$ MeV    | $p, \alpha$           | 1, 2, 3, 4 |
| 23                       | $4^-$      | broad                  | $\gamma, ^3\text{He}$ | 1, 3       |
| 26                       | $2^-$      | broad                  | $^3\text{He}$         | 1, 3       |
| 27                       | $3^-$      | broad                  | $^3\text{He}$         | 1          |

<sup>a</sup> See Table 6.8 in ([1974AJ01](#)).

- |  |                 |                |
|--|-----------------|----------------|
| 1. (a) $^3\text{He}(^3\text{He}, \gamma)^6\text{Be}$   | $Q_m = 11.489$  | $E_b = 11.489$ |
| (b) $^3\text{He}(^3\text{He}, p)^5\text{Li}$           | $Q_m = 10.90$   |                |
| (c) $^3\text{He}(^3\text{He}, 2p)^4\text{He}$          | $Q_m = 12.8596$ |                |
| (d) $^3\text{He}(^3\text{He}, ^3\text{He})^3\text{He}$ |                 |                |
| (e) $^3\text{He}(^3\text{He}, pd)^3\text{He}$          | $Q_m = -5.4936$ |                |
| (f) $^3\text{He}(^3\text{He}, 2p)^2\text{H}^2\text{H}$ | $Q_m = -10.987$ |                |
| (g) $^3\text{He}(^3\text{He}, 3p)^3\text{H}$           | $Q_m = -6.9544$ |                |

The yield of  $\gamma$ -rays to  $^6\text{Be}^*(1.7)$  (reaction (a)) increases smoothly from 0.4 to  $9.3 \mu\text{b}$  (assuming isotropy) for  $0.86 < E(^3\text{He}) < 11.8$  MeV ( $90^\circ$ ). No transitions were observed to  $^6\text{Be}(0)$  [ $\sigma < 0.01 \mu\text{b}$  at  $E(^3\text{He}) = 1.4$  MeV]. This is understood in terms of a direct capture of  $^3\text{He}$  by  $^3\text{He}$  in the singlet spin state and with zero angular momentum: the  $0^+ \rightarrow 0^+$   $\gamma$ -transition is forbidden. Reaction (a) is thus of negligible astrophysical importance compared to reaction (c): see ([1979AJ01](#)). The capture cross section from  $E(^3\text{He}) = 12$  MeV to 27 MeV continues to increase smoothly with energy at first and then shows a broad structure centered at  $E(^3\text{He}) = 23 \pm 1$  MeV [ $E_x = 23.0 \pm 0.5$  MeV],  $\Gamma_{\text{c.m.}} \approx 5$  MeV ([1974VE01](#)). This appears to be a  $^{33}\text{F}$  cluster resonance

which decays by an E1 transition to  ${}^6\text{Be}^*(1.7)$ . The  $\gamma$ -ray angular distributions are consistent with  $J^\pi = 3^-$  ([1974VE01](#)).

The analyzing power angular distribution has been measured at  $E({}^3\vec{\text{He}}) = 14$  MeV for the p<sub>0</sub> group (reaction (b)) ([1981KO34](#)). See also ([1979AJ01](#)) and  ${}^5\text{Li}$ .

Measurements of the total cross section for reaction (c) have been carried out for  $E({}^3\text{He}) = 60$  keV to 2.2 MeV. The measurements of ([1974DW01](#)), down to  $E_{\text{c.m.}} = 30$  keV, eliminate the possibility of a resonance [which might help explain the observed absence of solar neutrinos], unless it is extremely narrow ( $\Gamma \lesssim 100$  eV):  $\theta_p^2 \approx 3 \times 10^{-6}$  ([1974DW01](#)). The cross section factor  $S(E_{\text{c.m.}}) = [5.2 - 2.8E_{\text{c.m.}} + 1.4E_{\text{c.m.}}^2] \text{ MeV} \cdot \text{b}$  [error in  $S$  is  $\pm 20\%$  for  $E_{\text{c.m.}} > 40$  keV] ([1974DW01](#)). For the earlier work see ([1966LA04](#), [1974AJ01](#)). For polarization measurements (reaction (c)), see ([1979AJ01](#)).

The elastic scattering (reaction (d)) has been studied for  $E({}^3\text{He}) = 3$  to 32 MeV [see ([1979AJ01](#))] and at 120 MeV ([1980TA11](#); also inelastic processes). The excitation function shows a smooth monotonic behavior except for an anomaly at  $E({}^3\text{He}) = 25$  MeV in the  $L = 3$  partial wave corresponding to a broad state in  ${}^6\text{Be}$  at  $E_x \approx 24$  MeV. Polarization measurements have been carried out at  $E({}^3\vec{\text{He}}) = 17.9$  to 32.9 MeV ([1978VL01](#)). A two level  $R$ -matrix analysis of the phase shifts ( $L \leq 5$ ) suggests three broad F-wave states at  $E_x \approx 23.4(4^-)$ , 26.2(2<sup>-</sup>) and 26.7 MeV(3<sup>-</sup>) ([1978VL01](#)), in disagreement with the capture  $\gamma$ -ray results described above. See also ([1979AJ01](#)).

A kinematically complete experiment (reaction (e)) has been performed at  $E({}^3\text{He}) = 120$  MeV: large peaks were observed which appear to correspond to  ${}^3\text{He}-\text{d}$  quasi-free scattering followed by p-d FSI. No evidence was seen for excited states of  ${}^3\text{He}$  ([1978FU08](#)). See also ([1980TA11](#)). At  $E({}^3\text{He}) = 50$ , 65 and 78 MeV ([1978AL21](#), [1979LA14](#)) have examined reactions (c), (e), (f), (g) and have compared the results with PWIA: deviations are observed. See also ([1979PI11](#)), ([1979AJ01](#), [1982SL1A](#)), ([1980PE1N](#), [1982BA80](#), [1983TR1F](#); astrophysics) and ([1978FE07](#), [1979FU1F](#), [1981BA25](#), [1981HO23](#); theor.).

Neutron groups to  ${}^6\text{Be}^*(0, 1.7)$  have been observed at  $E({}^3\text{He}) = 19.4$  to 38.61 MeV: see Table 6.8 in ([1974AJ01](#)) for the parameters of the first excited state. There is no evidence for other states of  ${}^6\text{Be}$  with  $E_x \lesssim 5$  MeV, not for a state near the  ${}^3\text{He}$  threshold at 11.5 MeV: see ([1979AJ01](#)).

Neutron groups have been observed to  ${}^6\text{Be}^*(0, 1.7)$  as has the ground-state threshold. The width of the ground state is  $95 \pm 28$  keV. The parameters of  ${}^6\text{Be}^*(1.7)$  are displayed in Table 6.8 of ([1974AJ01](#)). Angular distributions have been reported at  $E_{\text{p}} = 8.3$  to 49.4 MeV [see ([1979AJ01](#))] and at  $E_{\text{p}} = 144$  MeV ([1980MO10](#);  $n_0$ ). See also ([1982KI1F](#);  $E_{\text{p}} = 800$  MeV). In reaction (b)

(1977WA05) report, at  $E_p = 47$  MeV, some evidence for sequential decay via  ${}^6\text{Be}^*(15.5 \pm 2, 24 \pm 2)$ . See also (1979RAZI, 1980GO1J), (1982PE06) and (1980BA2H, 1980DU16, 1983GU1G; theor.).

Triton groups have been observed to  ${}^6\text{Be}^*(0, 1.7)$ . The width of the ground state is  $89 \pm 6$  keV. The parameters of the excited state are displayed in Table 6.8 of (1974AJ01). No other excited states have been seen with  $E_x < 13$  MeV. There is no evidence for a state near 11.5 MeV; see (1979AJ01). The angular distribution of  $t_0$  has been studied by (1981BA37:  $E({}^3\text{He}) = 33.3$  MeV). The  $\alpha$ -spectrum following the  $\alpha + p + p$  decay of  ${}^6\text{Be}_{\text{g.s.}}$  has been measured by (1977GE02): the yield of low-energy  $\alpha$ -particles appears to be enhanced compared with calculations based on the available phase space. The continuum has also been studied by (1983DE14). See also (1981DE1X), (1979BA1H; theor.) and  ${}^9\text{B}$ .

See reactions 10 in  ${}^6\text{He}$  and 20 in  ${}^6\text{Li}$ .

Discrete states are not observed: see (1981DE1X, 1983DE14) [see also for a study of the continuum].

Not observed: see (1982NG01; theor.).

Not observed: see (1979AJ01).

## References

(Closed 1 June 1983)

References are arranged and designated by the year of publication followed by the first two letters of the first-mentioned author's name and then by two additional characters. Most of the references appear in the National Nuclear Data Center files (Nuclear Science References Database) and have NNDC key numbers. Otherwise, TUNL key numbers were assigned with the last two characters of the form 1A, 1B, etc. In response to many requests for more informative citations, we have, when possible, included up to ten authors per paper and added the authors' initials.
