

# Energy Levels of Light Nuclei

## $A = 13$

F. Ajzenberg-Selove

*University of Pennsylvania, Philadelphia, Pennsylvania 19104-6396*

**Abstract:** An evaluation of  $A = 13\text{--}15$  was published in *Nuclear Physics A360* (1981), p. 1. This version of  $A = 13$  differs from the published version in that we have corrected some errors discovered after the article went to press. Figures and introductory tables have been omitted from this manuscript. Also, [Reference](#) key numbers have been changed to the NNDC/TUNL format.

(References closed August 1, 1980)

The original work of Fay Ajzenberg-Selove was supported by the US Department of Energy [DE-AC02-76-ER02785]. Later modification by the TUNL Data Evaluation group was supported by the US Department of Energy, Office of High Energy and Nuclear Physics, under: Contract No. DEFG05-88-ER40441 (North Carolina State University); Contract No. DEFG05-91-ER40619 (Duke University).

## Table of Contents for *A* = 13

*Below is a list of links for items found within the PDF document. Figures from this evaluation are not included in the PDF document but have been scanned in and are available on this website or via the link below.*

E. Erratum to the Publication: [PS](#) or [PDF](#)

$^{13}\text{Li}$

(Not illustrated)

$^{13}\text{Li}$  has not been observed.  $^{13}\text{Li}$  is predicted to have an atomic mass excess of 61.56 MeV: it is then unstable for breakup into  $^{12}\text{Li} + \text{n}$  and  $^{11}\text{Li} + 2\text{n}$  by 0.6 and 4.5 MeV, respectively ([1974TH01](#)). The modified mass equation leads to a calculated atomic mass excess of 60.34 MeV:  $^{13}\text{Li}$  would then be stable with respect to breakup into  $^{12}\text{Li} + \text{n}$  by 0.7 MeV, assuming the a.m.u. of  $^{12}\text{Li}$  to be 52.94 MeV, but would be unstable with respect to  $^{11}\text{Li} + 2\text{n}$  by 3.3 MeV ([1975JE02](#)). See also ([1976AJ04](#)).

$^{13}\text{Be}$

(Not illustrated)

$^{13}\text{Be}$  has not been observed.  $^{13}\text{Be}$  is predicted to have an atomic mass excess of 35.35 MeV ([1974TH01](#)), 34.60 MeV ([1975JE02](#)). It is then unstable with respect to decay into  $^{12}\text{Be} + \text{n}$  by 2.20 MeV or by 1.45 MeV, respectively, based on the atomic mass excess of  $^{12}\text{Be}$ , 25.078 MeV ([1978AL29](#)). See also ([1976AJ04](#)) and ([1977SE1D](#); theor.).

$^{13}\text{B}$

(Figs. 1 and 4)

GENERAL: (See also ([1976AJ04](#))).

*Experimental work on complex reactions in which  $^{13}\text{B}$  is observed:* ([1976BU16](#), [1977AR06](#), [1978GE1C](#), [1978KO01](#), [1979LEZR](#)).

*Reviews and theoretical papers:* ([1976AB04](#), [1976VA29](#), [1977DO06](#), [1978AB08](#), [1978DE15](#), [1979AL22](#), [1979BE1H](#), [1979BO22](#), [1980MA1F](#), [1980MU1B](#)).

$$Q = 0.0478 \pm 0.0046 \text{ b} \quad (\text{1973HAVZ}, \text{1978LEZA}).$$

$$\mu = +3.17778 \pm 0.00051 \text{ nm} \quad (\text{1978LEZA}).$$

$$1. \quad ^{13}\text{B}(\beta^-)^{13}\text{C} \qquad Q_m = 13.437$$

The half-life of  $^{13}\text{B}$  is  $17.33 \pm 0.17$  msec ([1971WI07](#)). The mean of this and a previously reported measurement is  $17.36 \pm 0.16$  msec ([1971WI07](#)). The branching ratios of various  $^{13}\text{C}$  states are shown in Table 13.2: they indicate  $J^\pi = \frac{1}{2}^-$  and  $\frac{3}{2}^-$  for  $^{13}\text{B}_{\text{g.s.}}$ . See also ([1976AJ04](#)) and ([1977AZ02](#), [1977MA16](#), [1977RI08](#), [1979DE15](#); theor.).

Table 13.1: Energy levels of  $^{13}\text{B}$ 

$E_x$ (MeV $\pm$ keV)	$J^\pi; T$	$\tau$ or $\Gamma_{\text{cm}}$ (keV)	Decay	Reactions
g.s.	$\frac{3}{2}^-; \frac{3}{2}$	$\tau_{1/2} = 17.36 \pm 0.16$ msec	$\beta^-$	1, 2, 3, 4, 5, 6, 7, 8, 9
3.483 $\pm$ 5	a		$\gamma$	2, 4

(11.80)				4

<sup>a</sup> See Table 13.3.

Table 13.2: Beta decay of  $^{13}\text{B}$  <sup>a</sup>

Decay to $^{13}\text{C}^*$ (MeV)	$J^\pi$	Branch (%)	$\log ft$ <sup>b</sup>
0	$\frac{1}{2}^-$	$92.1 \pm 0.8$	$4.01 \pm 0.01$
3.09	$\frac{1}{2}^+$	$\leq 0.7$	$\geq 5.7$
3.68	$\frac{3}{2}^-$	$7.6 \pm 0.8$	$4.45 \pm 0.04$
3.85	$\frac{5}{2}^+$	$\leq 0.7$	$\geq 5.5$
7.55 <sup>c</sup>	$\frac{5}{2}^-$	$0.094 \pm 0.020$	$5.33 \pm 0.08$
8.86	$\frac{1}{2}^-$	$0.16 \pm 0.03$	$4.60 \pm 0.08$
9.50	$(\frac{3}{2}^-)$	$< 0.01$	$> 5.2$
9.90	$\frac{3}{2}^-$	$0.022 \pm 0.007$	$4.95 \pm 0.12$

<sup>a</sup> ([1969JO21](#), [1974AL12](#)). See also Table [13.24](#).

<sup>b</sup> Log  $ft$  shown here are based on  $\tau_{1/2} = 17.33 \pm 0.17$  msec

([1971WI07](#)). See also ([1977RI08](#); theor.).

<sup>c</sup>  $E_x = 7.577 \pm 0.030$  MeV ([1974AL12](#)).

Observed proton groups are shown in Table [13.3](#) ([1972WY01](#)). For angular distribution measurements see ([1969CA1A](#)). The lifetimes of  $^{13}\text{B}^*(3.53, 3.71, 4.13)$  are, respectively,  $> 0.3$ ,  $< 0.38$  and  $0.062 \pm 0.050$  psec:  $E_\gamma = 3536.3 \pm 4.2$  and  $4133.4 \pm 7.8$  keV ([1969TH01](#)). See also  $^{14}\text{C}$ .

See  $^{14}\text{C}$ .

Observed proton groups are displayed in Table [13.3](#). Angular distributions have been measured at  $E_t = 11$  MeV ([1964MI04](#)) and 23 MeV ([1978AJ02](#)).

Table 13.3: Proton groups from  ${}^7\text{Li}({}^7\text{Li}, \text{p}){}^{13}\text{B}$  and  ${}^{11}\text{B}(\text{t}, \text{p}){}^{13}\text{B}$ 

${}^7\text{Li}({}^7\text{Li}, \text{p}){}^{13}\text{B}$ (1972WY01)	${}^{11}\text{B}(\text{t}, \text{p}){}^{13}\text{B}$				
	(1964MI04)			(1978AJ02)	
	$E_x$ (MeV $\pm$ keV)	$E_x$ (MeV $\pm$ keV)	$L$	$J^\pi$	$E_x$ (MeV $\pm$ keV)
0	0	0	$\frac{3}{2}^-$	0	
a	$3.483 \pm 5$	1	$(\frac{1}{2}, \frac{3}{2}, \frac{5}{2})^+$	$g$	$3.482 \pm 10$

					$10.22 \pm 20$
					$10.89 \pm 20$
					(11.80)

<sup>a</sup> See text.

<sup>b</sup> The decay is primarily by  $\gamma_0$ : the upper limit to the cascade via  ${}^{13}\text{B}^*(3.5)$  is 10%.

<sup>c</sup> The decay is  $75 \pm 10\%$ ,  $25 \pm 10\%$  and  $< 10\%$ , respectively to  ${}^{13}\text{B}^*(0, 3.5, 3.7)$ .

<sup>d</sup> All values in this column are based on  $E_x = 4131$  keV for  ${}^{13}\text{B}^*(4.13)$ .

<sup>e</sup>  $\Gamma = 15 \pm 5$  keV.

<sup>f</sup> Not observed.

<sup>g</sup> See, however, (1978AJ02), p. 1289.

<sup>h</sup>  $L \geq 4$ .

See ([1975WI26](#)).

See ([1979MAZW](#)) and ([1979TR1B](#)).

At  $E_d = 52$  MeV angular distributions for  $^{13}\text{B}^*(0, 3.7)$  have been reported ([1975MA41](#)).

At  $E_t = 23$  MeV the angular distribution for  $\alpha_0$  has been analyzed by ([1979SE07](#)): the DWBA fit is poor. The extracted  $S(\frac{3}{2}) = 5.7$ , near that predicted for a filled  $p_{3/2}$  shell.

See ([1980NA14](#)).

<sup>a</sup> See also Table 13.5 in (1976AJ04).

$^{13}\text{C}^*(3.85) [J^\pi = \frac{5}{2}^+]$ :  $g$  is negative (1976DY05).

1. (a) $^6\text{Li}(^7\text{Li}, \text{n})^{12}\text{C}$	$Q_m = 20.924$	$E_b = 25.870$
(b) $^6\text{Li}(^7\text{Li}, \text{p})^{12}\text{B}$	$Q_m = 8.337$	
(c) $^6\text{Li}(^7\text{Li}, 2\text{n})^{11}\text{C}$	$Q_m = 2.203$	
(d) $^6\text{Li}(^7\text{Li}, \text{d})^{11}\text{B}$	$Q_m = 7.192$	
(e) $^6\text{Li}(^7\text{Li}, \text{t})^{10}\text{B}$	$Q_m = 1.994$	
(f) $^6\text{Li}(^7\text{Li}, \alpha)^9\text{Be}$	$Q_m = 15.223$	

The yield curves for  $d_0(E(^6\text{Li}) = 4 \text{ to } 14 \text{ MeV})$ ,  $t_0(E(^7\text{Li}) = 5 \text{ to } 14 \text{ MeV})$  and  $\alpha_0(E(^6\text{Li}) = 4 \text{ to } 14 \text{ MeV})$  show broad, uncorrelated structures. Energy-averaged differential cross sections are also reported for a number of  $^{12}\text{B}$ ,  $^{11}\text{B}$  and  $^{10}\text{B}$  states (1971WY01). Total cross section measurements have been measured for  $E(^7\text{Li}) = 3.8 \text{ to } 6.0 \text{ MeV}$  for  $p_0 \rightarrow p_2, p_{3+4}, p_5; d_0 \rightarrow d_3, d_{4+5}, d_6; t_0 \rightarrow t_2;$  and  $\alpha_0$ : total cross sections generally increase smoothly with energy without showing any structure (1967KI03). The  $^{11}\text{C}$  yield has been measured for  $E(^6\text{Li}) = 1.2 \text{ to } 3.6 \text{ MeV}$  by (1961NO05). See also  $^9\text{Be}$  and  $^{10}\text{B}$  in (1979AJ01) and  $^{11}\text{B}$  and  $^{12}\text{B}$  in (1980AJ01).

<sup>b</sup>  $E_x = 3089.443 \pm 0.020$  keV,  $E_\gamma = 3089.049 \pm 0.020$  keV\* (1980WA24: here, and in footnote<sup>d</sup> measured values are starred (\*); the others are derived).

<sup>c</sup> Branching ratio for cascade via  $^{13}\text{C}^*(3.09)$  is  $0.75 \pm 0.04\%$  (1980WA24). See also (1975TR07).  $E_x = 3684.482 \pm 0.023$  keV,  $E_\gamma = 3683.921 \pm 0.023$  keV.  $\delta(\text{E2/M1}) = -0.094 \pm 0.009$ .  $E_\gamma$  for transition to  $^{13}\text{C}^*(3.09)$  is  $595.013 \pm 0.011$  keV (1980WA24).

<sup>d</sup> Branching ratios for cascades via  $^{13}\text{C}^*(3.68, 3.09)$  are  $36.3 \pm 0.6\%$  and  $1.20 \pm 0.04\%$ , respectively (1980WA24). See also (1975TR07).  $E_x = 3853.783 \pm 0.022$  keV,  $E_\gamma = 3853.170 \pm 0.022$  keV;  $E_\gamma$  for the transitions to  $^{13}\text{C}^*(3.09, 3.68)$  are  $764.316 \pm 0.010$  keV\* and  $169.300 \pm 0.004$  keV\* (1980WA24).

<sup>e</sup> The ground state branching ratio is  $62.5 \pm 0.6\%$  (1980WA24) and  $\delta(\text{E3/M2}) = +0.12 \pm 0.03$  (1966PO11).

<sup>f</sup> Branching ratio for cascade via  $^{13}\text{N}^*(2.37)$  is  $8 \pm 1\%$  (1974RO29). See also footnote<sup>j</sup> in Table 13.21.

$$2. \ ^7\text{Li}(^7\text{Li}, \text{n})^{13}\text{C} \quad Q_m = 18.620$$

See (1978KA1H) and (1970AJ04).

$$3. \ ^9\text{Be}(\alpha, \gamma)^{13}\text{C} \quad Q_m = 10.6479$$

See (1976AJ04).

$$\begin{array}{lll} 4. \text{ (a)} \ ^9\text{Be}(\alpha, \text{n})^{12}\text{C} & Q_m = 5.7015 & E_b = 10.6479 \\ \text{ (b)} \ ^9\text{Be}(\alpha, 2\text{n})^{11}\text{C} & Q_m = -13.020 & \end{array}$$

Resonances for  $n_0$  and  $n_1$ , for  $\gamma$ -rays from  $^{12}\text{C}^*(4.4, 12.7, 15.1)$  and resonances in the total neutron cross section are given in Table 13.8. The yield of neutrons to  $^{12}\text{C}^*(7.65, 9.64)$  has been measured in the range  $E_\alpha = 2.9\text{--}6.4$  MeV (1972OB01). The  $n_0$  and  $n_1$  excitation functions exhibit weak resonance anomalies at  $E_\alpha = 6.44$  MeV corresponding to the  $J^\pi = \frac{3}{2}^-$ ,  $T = \frac{3}{2}$  state at  $E_x = 15.11$  MeV: see Tables 13.7 and 13.8 (1978HI06). Based on all available information the charge asymmetry of the reduced transition strengths,  $\delta \equiv B(^{13}\text{C})/B(^{13}\text{N}) - 1$ ,  $\delta(\text{M1}) = -0.15 \pm 0.07$  and  $\delta(\text{E2}) = 1.0 \pm 0.6$  (1978HI06).

Table 13.7: Parameters of the first  $T = \frac{3}{2}$  states in  $^{13}\text{C}$  and  $^{13}\text{N}$ <sup>a</sup>

	$^{13}\text{C}^*(15.11)$	$^{13}\text{N}^*(15.06)$
$E_x$ (MeV)	$15.1082 \pm 0.0012$	$15.0646 \pm 0.0009$
$J^\pi$	$\frac{3}{2}^-$	$\frac{3}{2}^-$
$\Gamma_{\text{cm}}$ (keV)	$5.49 \pm 0.25$	$0.932 \pm 0.028$
$\Gamma_{\gamma_0}$ (eV)	$22.4 \pm 1.5$ (M1), $0.6 \pm 0.1$ (E2) <sup>k</sup>	$24.2 \pm 1.5$ (M1) <sup>e</sup> $0.32 \pm 0.12$ (E2) <sup>f</sup>
$\Gamma_{\gamma_1}$ (eV)	$4.12 \pm 0.74$	$\leq 2.82 \pm 0.30$ <sup>g</sup>
$\Gamma_{\gamma_{2+3}}$ (eV)	$18.2 \pm 2.4$	$19.6 \pm 1.4$ <sup>h</sup>
$\Gamma_{\gamma_0}/\Gamma$ (%)	$0.396 \pm 0.030$ <sup>b</sup>	
$\Gamma_{p_0}\Gamma_{\gamma_0}/\Gamma$ (eV)		$5.79 \pm 0.20$
$\Gamma_{\gamma_0}/\Gamma_{p_0}$ (%)		$12.1 \pm 1.1$
$\Gamma_{n_0}$ or $\Gamma_{p_0}$ (keV) <sup>c</sup>	$0.38 \pm 0.10$	$0.228 \pm 0.016$ <sup>i</sup>
$\Gamma_{n_1}$ or $\Gamma_{p_1}$ (keV) <sup>c</sup>	$1.43 \pm 0.18$	$0.140 \pm 0.014$ <sup>i</sup>
$\Gamma_{n_2}$ or $\Gamma_{p_2}$ (keV) <sup>c</sup>	$0.14 \pm 0.10$	$0.049 \pm 0.015$ <sup>i</sup>
$\Gamma_{p_3}$ (keV) <sup>c</sup>		$0.089 \pm 0.014$ <sup>i</sup>
$\Gamma_{p_5}$ (keV) <sup>c</sup>		$0.15 \pm 0.04$ <sup>i</sup> <sup>j</sup>
$\Gamma_{\alpha_0}$ (keV) <sup>d</sup>	$0.104 \pm 0.028$	$0.046 \pm 0.026$ <sup>i</sup>
$\Gamma_{\alpha_1}$ (keV) <sup>d</sup>		$0.036 \pm 0.036$ <sup>i</sup>
$\Gamma_{\alpha_2}$ (keV) <sup>d</sup>		$0.067 \pm 0.042$ <sup>i</sup>

<sup>a</sup> (1973AD02, 1973HU07, 1975HI07, 1975MA21, 1977MA16, 1978HI06, 1979AD01, 1980TH05).

<sup>b</sup> The decay width to  $^{13}\text{C}^*(7.55)$  is  $< 0.9$  eV (1977MA16).

<sup>c</sup> Widths for  $^{13}\text{C}^*(15.11) \rightarrow ^{12}\text{C}_{\text{g.s.}} + n_0$  or  $^{13}\text{N}^*(15.06) \rightarrow ^{12}\text{C}_{\text{g.s.}} + p_0$  [ $n_1, p_1; n_2, p_2$ ; and  $p_3$  and  $p_5$  refer to the decays to  $^{12}\text{C}^*(4.4, 7.7, 9.6, 10.8)$  respectively].

<sup>d</sup> Widths for  $^{13}\text{C}^*(15.11) \rightarrow ^9\text{Be}_{\text{g.s.}} + \alpha_0$  or  $^{13}\text{N}^*(15.06) \rightarrow ^9\text{B}_{\text{g.s.}} + \alpha_0$  [ $\alpha_1$  and  $\alpha_2$  refer to the decays to  $^9\text{B}^*((1.6), 2.4)$ ].

<sup>e</sup>  $\delta = -0.07 \pm 0.13$  (1975MA21). Here  $\delta \equiv B(^{13}\text{C})/B(^{13}\text{N}) - 1$ .

<sup>f</sup>  $\delta = 0.82^{+1.2}_{-0.6}$  (1975MA21).

<sup>g</sup>  $\delta \geq 0.83 \pm 0.29$  (1975MA21).

<sup>h</sup>  $\delta = -0.04 \pm 0.14$  (1975MA21).

<sup>i</sup> Based on measured branching ratios and on  $\Gamma_{\text{cm}} = 0.932 \pm 0.028$  keV (1980TH05).

<sup>j</sup> The decay width to  $^{12}\text{C}^*(12.71)$  is  $< 0.13$  keV. It is expected to be  $\approx 0.03$  keV. The sum of the branching ratios for all measured decays of  $^{13}\text{N}^*(15.06)$  is  $92 \pm 8\%$ . It is apparent from the character of the decay modes of this state that 2s-1d shell isospin admixtures are important (1979AD01).

<sup>k</sup> See also (1979JU01).

(b) ${}^9\text{Be}(\alpha, \text{d}){}^{11}\text{B}$	$Q_m = -8.0308$	
(c) ${}^9\text{Be}(\alpha, \text{t}){}^{10}\text{B}$	$Q_m = -13.229$	

Excitation curves have been measured for  $E_\alpha = 15$  to 25 MeV (1975VA19;  $d_0, d_1$ ) and 26.5 to 27.5 MeV (1975PU01;  $d_0 \rightarrow d_3, d_{4+5}, d_6$ ): no sharp structures are observed. See also  ${}^{11}\text{B}$  in (1980AJ01). At  $E_\alpha = 26.0$  to 27.5 MeV yield curves have been obtained for the  $t_0, t_1$  and  $t_3$  groups: no structure is observed (1974KE06). See also (1976LE1K) and (1968AJ02) for reaction (a).

6. ${}^9\text{Be}(\alpha, \alpha){}^9\text{Be}$		$E_b = 10.6479$
---	--	-----------------

A number of exciation functions have been measured for elastically scattered  $\alpha$ -particles (reaction (a)) for  $E_\alpha = 1.4$  to 20 MeV: these show considerable resonance structure with the variations being most prominent below 10 MeV but persisting up to 20 MeV. The parameters resulting from a best-fit of the exciation functions are displayed in Table 13.9: see the footnotes to that table for a summary of the most important caveats (1973GO15). A weak resonance is observed in the  $\alpha_0$  yield at  $E_\alpha = 6.44$  MeV corresponding to the excitation of the first  $T = \frac{3}{2}$  state at  $E_x = 15.11$ : see Table 13.7 for the parameters of that state (1978HI06). See also (1974LO1B, 1979AJ01).

7. ${}^9\text{Be}({}^6\text{Li}, \text{d}){}^{13}\text{C}$	$Q_m = 9.174$	
--	---------------	--

At  $E({}^6\text{Li}) = 23.8$  MeV angular distributions are reported to  ${}^{13}\text{C}^*(0, 3.1, 3.6, 6.9, 7.5, 9.9, 10.8, 12.0, 13.3)$ . There is some indication of the population of  ${}^{13}\text{C}^*(9.5, 13.9, 14.5, 15.2, 16.7, 18.5)$  (1971GO24).

8. ${}^9\text{Be}({}^7\text{Li}, \text{t}){}^{13}\text{C}$	$Q_m = 8.181$	
--	---------------	--

At  $E({}^7\text{Li}) = 5.6$  to 6.2 MeV angular distributions are reported for  $t_0, t_1, t_{2+3}, t_4$  (1969SN02). See also (1976AJ04).

Table 13.9: Resonances in  ${}^9\text{Be}(\alpha, \alpha_0)$ <sup>a</sup>

$E_\alpha$ (MeV)	$\Gamma_{\text{cm}}$ (keV)	$l_\alpha$	$J^\pi$	${}^{13}\text{C}^*$ (MeV)
1.93 <sup>b</sup>	180 <sup>b</sup>	1, 0	$\frac{5}{2}^+$	11.98
3.80	343	0, 2	$\frac{3}{2}^-$ <sup>c</sup>	13.28
4.00	58	(4, 6)	$(\frac{9}{2}^-)$	13.42
4.20	685	1, 3	$\frac{5}{2}^+$ <sup>d</sup>	13.56
4.50	247	1, 3	$\frac{3}{2}^+$ <sup>d</sup>	13.76
5.00	75	2, 4	$\frac{5}{2}^-$ <sup>e</sup>	14.11
5.075	73	3, 5	$\frac{7}{2}^+$ <sup>e</sup>	14.162
(5.50)	400	(1, 3)	$(\frac{5}{2}^+)$	(14.46)
6.44	f		$\frac{3}{2}^-$ ; $T = \frac{3}{2}$	15.11

<sup>a</sup> (1973GO15): from analysis in the single-level approximation. This assumes the  $J^\pi$  ordering suggested by (1965LI09).

<sup>b</sup> This resonance is reported by (1974SA16). It is not clear whether the  $\Gamma$  is in the cm or lab systems.  $\Gamma_\alpha$  is given as 72 keV.

<sup>c</sup> Favored by the analysis but the assignment is not certain and more than one state may be involved.

<sup>d</sup> (1973DE14) suggest the opposite ordering [ $\frac{3}{2}^+, \frac{5}{2}^+$ ]: see Table 13.8.

<sup>e</sup> An equally good fit to the data is obtained with a  $\frac{7}{2}^-$  state at 5.0 MeV and a  $(\frac{3}{2}, \frac{5}{2}, \frac{7}{2})^+$  state at 5.08 MeV.

<sup>f</sup> Weak anomaly at  $E_\alpha = 6443.5 \pm 2.0$  keV: see Table 13.7 for parameters of 15.11 MeV state, and reaction 4 (1978HI06).

### 9. ${}^9\text{Be}({}^{12}\text{C}, {}^8\text{Be}){}^{13}\text{C}$

$$Q_m = 3.2812$$

Angular distributions have been measured at  $E({}^{12}\text{C}) = 12$  and 15 MeV (1970BA49, 1971BA68) and  $E({}^9\text{Be}) = 20$  MeV (1979JA1G, 1979BO1K) for the transitions to  ${}^{13}\text{C}^*(0, 3.09, 3.85)$  and in addition to  ${}^{13}\text{C}^*(3.68)$  in the latter experiment. The neutron spectroscopic factors are 1.15, 0.95, 0.20, 1.02 for the first four states of  ${}^{13}\text{C}$  (1979JA1G). See also (1976AJ04). At  $E({}^9\text{Be}) = 50$  MeV  ${}^{13}\text{C}^*(6.86, 7.5, 8.2, 9.5, 10.8)$  are also populated (1977ST20). For yield measurements [total cross sections, and transitions involving  ${}^{13}\text{C}^*(0, 3.09, 3.68, 3.85, 6.86, 7.5)$ ], see (1977SW05, 1978CH02, 1978MA44, 1979BO06). See also (1977UH1A).

### 10. ${}^9\text{Be}({}^{14}\text{N}, {}^{10}\text{B}){}^{13}\text{C}$

$$Q_m = -0.9653$$

See (1970AJ04).

See ([1976EP1A](#); astrophys.).

12. (a) $^{10}\text{B}(\text{t}, \text{p})^{12}\text{B}$	$Q_m = 6.343$	$E_b = 23.8766$
(b) $^{10}\text{B}(\text{t}, \text{d})^{11}\text{B}$	$Q_m = 5.1979$	
(c) $^{10}\text{B}(\text{t}, \alpha)^9\text{Be}$	$Q_m = 13.2287$	

The  $p_0$  and  $p_1$  yields from reaction (a), the  $d_0$  yield from reaction (b) and the  $\alpha_0$  yield from reaction (c) have been determined for  $E_t = 0.8$  to  $2.0$  MeV. There is no evidence of resonance behavior ([1963HO19](#)). See also ([1977ST1N](#);  $p_0, p_1, p_5, p_6$ ) and ([1977CI1A](#);  $\alpha_0 \rightarrow \alpha_3$ ), both in the interval  $E_t = 0.5$  to  $1.25$  MeV.

Proton groups have been observed to the first four states of  $^{13}\text{C}$ : see ([1976AJ04](#)). Angular distributions of  $p_0$  have been measured at many energies up to  $E_\alpha = 30.4$  MeV: see ([1970AJ04](#)) and  $^{14}\text{N}$ . For  $\tau_{1/2}$  measurements see Table 13.5 in ([1976AJ04](#)). For the decay of  $^{13}\text{C}^*(3.85)$  see Table [13.6](#) ([1980WA24](#)). See also ([1976EP1A](#); astrophys.).

Comparisons of the relative intensities of the  $^3\text{He}$  groups in this reaction and of the triton groups in the mirror reaction (see reaction 9 in  $^{13}\text{N}$ ) at  $E(^6\text{Li}) = 18$  MeV suggest that the following states are analogs:  $6.86 - 6.36, 7.49 - 7.16, 9.50 - 9.00, 9.90 - 9.48, (10.82 + 10.75) - (10.36 + 10.36)$  [the first (set of)  $E_x$  is in  $^{13}\text{C}$ , the second in  $^{13}\text{N}$ ]. An angular distribution is also reported for  $^{13}\text{C}^*(9.50)$  and the widths for  $^{13}\text{C}^*(7.55, 7.69, 9.50)$  are determined to be  $< 30, 60 \pm 30$  and  $< 30$  keV, respectively ([1974HO06](#)).

Angular distributions have been measured at  $E(^7\text{Li}) = 5.20$  MeV for the  $\alpha_0, \alpha_1, \alpha_{2+3}$  and  $\alpha_4$  groups ([1966MC05](#)).

At  $E(^{10}\text{B}) = 100$  MeV angular distributions are reported for the transitions to  $^{13}\text{C}^*(0, 3.68, 7.5, 11.8)$  ([1975NA15](#), [1976NA09](#)). See also ([1979MO14](#)).

The  $90^\circ \gamma_0$  excitation curve measured for  $E_{\text{d}} = 1.0$  to  $4.2$  MeV shows a resonance at  $E_{\text{d}} = 2.0 \pm 0.1$  MeV ( $^{13}\text{C}^*(20.4)$ ) with  $\Gamma_{\text{lab}} \approx 0.6$  MeV. The angular distributions of  $\gamma_0$  are isotropic to within 10% on and off resonance, consistent with E1 radiation ([1973WE12](#)).

The yield of neutrons and  $\gamma$ -rays has been measured for  $E_{\text{d}} = 0.2$  to  $11$  MeV: observed resonances are displayed in Table 13.10. For a listing of polarization measurements see Table 13.11 in ([1976AJ04](#)) and ([1975SI22](#);  $E_{\text{d}} = 0.9$  and  $1.2$  MeV;  $n_0, n_1$ ). See also ([1974LO1B](#), [1977SE09](#)) and  $^{12}\text{C}$  in ([1980AJ01](#)).

Some measurements show that the thin-target yield rises smoothly from  $E_{\text{d}} = 0.3$  to  $3.1$  MeV with no evidence of resonances: see ([1970AJ04](#)). However, ([1964BR1A](#)) and ([1968CH05](#)) report a resonance in the yields of  $p_0$ ,  $p_1$  and  $p_2$ , and of  $\gamma_1$  and  $\gamma_2$ : see Table 13.10. For polarization measurements see ([1976AJ04](#)) and ([1976TA07](#);  $1.0$  to  $4.0$  MeV;  $p_0$ ). See also ([1974FI1D](#), [1976HA1J](#)), ([1977SA25](#); theor.) and  $^{12}\text{B}$  in ([1980AJ01](#)).

A polarization measurement has been reported at  $E_{\text{d}} = 12.6$  MeV ([1971ZA04](#)). See also  $^{11}\text{B}$  in ([1980AJ01](#)).

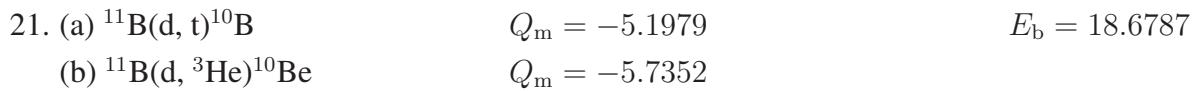

Table 13.10: Resonant structure in  $^{11}\text{B} + \text{d}$ 

$\gamma_0$ <sup>a</sup>	Resonant structure in yield of								$\Gamma_{\text{cm}}$ (keV)	$E_x$ (MeV)
	$n_0$ <sup>b</sup>	$n_1$ <sup>b</sup>	$n_2$ <sup>b</sup>	$n_3$ <sup>b</sup>	$\gamma_{15.1}$ <sup>c</sup>	p	$\gamma_{0.9}, \gamma_{1.7}$ <sup>d</sup>	$\alpha$ <sup>e</sup>

$2.0 \pm 100$	1.45	1.2				1.5 <sup>g</sup>			$\approx 600$	19.7 <sup>i</sup>
	1.6	1.8 <sup>f</sup>						1.85	$\approx 200$	19.90
		2.2 <sup>f</sup>			$2.180 \pm 10$	2.2 <sup>g,h</sup>	$\approx 2.1$		$116 \pm 10$	20.24
					$3.080 \pm 15$	3.0 <sup>g</sup>			$159 \pm 15$	20.52
	3.6				$3.71 \pm 20$				$114 \pm 21$	21.28
	4.23	4.0	4.1		4.4				broad	21.81
	(5.2)									(23.1)
	9.6	9.6	9.6	9.6						22.23
	10.4		10.4	10.4						26.8
										27.5

<sup>a</sup> (1973WE12):  $\Gamma_{\text{lab}} \approx 600$  keV.

<sup>b</sup> (1965AL17, 1967DI01, 1972TH14).

<sup>c</sup> (1958KA31, 1964KU09).

<sup>d</sup> Broad resonance in yields of  $\gamma_{0.95}$  and  $\gamma_{1.67}$  (1968CH05).

<sup>e</sup> Yield of  $\alpha_0, \alpha_1, \alpha_2, \alpha_3$  (1969FR03).

<sup>f</sup> (1965AL17) report a resonance at 1.8 MeV while (1967DI01) report one at 2.2 MeV, in addition to a sharper structure at 1.2 MeV.

<sup>g</sup> Resonance in polarization of  $^{12}\text{B}$  recoils (1967PF02).

<sup>h</sup> Yield of  $p_0, p_1$  and  $p_2$  (1964BR1A).

<sup>i</sup> (1971RI19, 1972SE09) suggest  $J^\pi = \frac{5}{2}^-$ .

See (1976AJ04) and  $^{10}\text{B}$  and  $^{10}\text{Be}$  in (1979AJ01).

$$22. \ ^{11}\text{B}(\text{d}, \alpha)^9\text{Be} \quad Q_m = 8.0308 \quad E_b = 18.6787$$

At low energies the excitation functions for  $\alpha_0$  and  $\alpha_1$  increase monotonically: see (1970AJ04). Then at  $E_d = 1.85$  MeV a pronounced resonance is observed in the  $\alpha_0, \alpha_1, \alpha_2$  and  $\alpha_3$  yields (1969FR03). Some gross structure is also observed in these yields for  $E_d = 1.0$  to 3.2 MeV (1964BR1A, 1969FR03). See also (1978GR07) and  $^9\text{Be}$  in (1979AJ01).

$$23. \ ^{11}\text{B}(\text{t}, \text{n})^{13}\text{C} \quad Q_m = 12.4214$$

See  $^{14}\text{C}$ .

Levels derived from proton groups are displayed in Table 13.11. The decay parameters for the first  $T = \frac{3}{2}$  state at  $E_x = 15.11$  MeV are displayed in Table 13.7 (1973AD02, 1975MA21, 1977MA16). See also reactions 11 and 13 in  $^{13}\text{N}$ . The reduced asymmetries  $B(^{13}\text{C})/B(^{13}\text{N}) - 1$  are  $-0.07 \pm 0.13$ ,  $0.82^{+1.2}_{-0.6}$ ,  $\leq 0.83 \pm 0.29$  and  $-0.04 \pm 0.14$  for the  $\gamma_0(\text{M1})$ ,  $\gamma_0(\text{E2})$ ,  $\gamma_1(\text{E1})$  and  $\gamma_2(\text{M1})$  transitions. Changes in the wave functions due to binding energy differences in  $^{13}\text{C}$  and  $^{13}\text{N}$  do not account for the observed asymmetry of the E1 decays of the first excited states in  $^{13}\text{C}$  and  $^{13}\text{N}$  (1977MA16): see Table 13.6.

Angular distributions of proton groups have been measured at many energies to  $E(^3\text{He}) = 12$  MeV: see (1970AJ04, 1976AJ04). See also (1979HAYZ) and (1976EP1A; astrophys.).

Angular distributions of the d<sub>0</sub> group have been measured at  $E_\alpha = 15.1$  to 25.2 MeV (1975VA19) and 23 and 25 MeV (1967AL16). See also (1976LE1K).

Angular distributions are reported at  $E(^6\text{Li}) = 4.72$  MeV for  $\alpha_0, \alpha_1, \alpha_{2+3}, \alpha_4, \alpha_{5+6+7}$  (1966MC05).

Angular distributions involving the ground state transitions have been measured at  $E(^{14}\text{N}) = 41, 77$  and 113 MeV (1971LI11). See also (1978DZ1A; theor.).

See (1976AJ04).

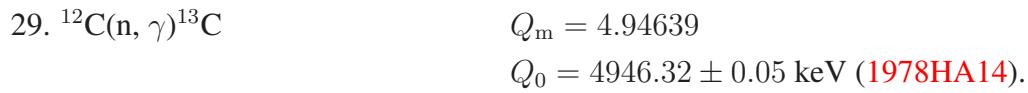

Table 13.11: Levels of  $^{13}\text{C}$  from  $^{11}\text{B}({}^3\text{He}, \text{p})^{13}\text{C}$ <sup>a</sup>

$E_x$ (MeV $\pm$ keV)	$\Gamma_{\text{c.m.}}$ (keV)

$10.76 \pm 10$	
$10.82 \pm 10$	
$11.01 \pm 10$	
$11.09 \pm 10$	
(11.72) <sup>d</sup>	
15.11 <sup>e</sup>	

<sup>a</sup> A number of higher states were reported in Table 13.7 of (1970AJ04): however, the references for these levels have not been published. References for the data shown here are displayed in Table 13.12 (1976AJ04).

<sup>b</sup> Decay is by n-emission to  $^{12}\text{C}_{\text{g.s.}}$ : branching ratio =  $0.99 \pm 0.09$  (1973AD02).

<sup>c</sup> Branching ratios for neutron decay to  $^{12}\text{C}^*(0, 4.4) = 1.0 \pm 0.2$  and  $< 0.15$ , respectively (1973AD02).

<sup>d</sup> For this state these branching ratios are  $0.67 \pm 0.16$  and  $0.33 \pm 0.08$ , respectively (1973AD02).

<sup>e</sup> See Table 13.7 for the parameters of this state.

See also previous values listed in (1976AJ04) and (1974SP04, 1979GR1J [preliminary value  $4946.329 \pm 0.024$  keV]). The thermal capture cross section is  $3.4 \pm 0.3$  mb (1973MU14). The capture is  $32 \pm 1\%$  via  $^{13}\text{C}^*(3.68)$  and  $68 \pm 1\%$  to  $^{13}\text{C}_{\text{g.s.}}$  (1968SP01).  $^{13}\text{C}^*(3.68)$  decays with  $E_\gamma = 3684.28 \pm 0.14$  keV (1968SP01),  $3683.94 \pm 0.17$  keV (1967PR10): see Table 13.13 in (1976AJ04) for other data. See also (1978AR1N), (1980DO1C; astrophys.) and (1977MA06; theor.).

30. (a) $^{12}\text{C}(\text{n}, \text{n})^{12}\text{C}$	$E_b = 4.94639$
(b) $^{12}\text{C}(\text{n}, \text{n}')^{12}\text{C}^*$	
(c) $^{12}\text{C}(\text{n}, \text{n}')^4\text{He}^4\text{He}^4\text{He}$	$Q_m = -7.2748$

The coherent scattering length (thermal, bound)  $a_{\text{coh}} = 6.6535 \pm 0.0014$  fm;  $\sigma_{\text{scatt}} = 4.7456 \pm 0.0020$  b (1979KO26). See (1978FU1G) for an  $R$ -matrix analysis of all the data below the inelastic channel and for best values of the elastic scattering cross sections.

Total cross section measurements in the range 1 keV to 273 GeV/c are listed in Table 13.14 of (1976AJ04) and displayed in (1976GAYV). Recent  $\sigma_t$  measurements are reported by (1979SM08; 0.1 to 4.5 MeV), (1979AU07; 1.2 to 13.9 MeV) and (1980CI03; 4.5 to 8 MeV). Cross sections for populating  $^{12}\text{C}^*(4.4)$  [by observing  $n_1$  or 4.4 MeV  $\gamma$ -rays] have recently been reported by (1975RO30;  $4.8 \rightarrow 20$  MeV), (1977DI11;  $5 \rightarrow 19$  MeV), (1978HA1P;  $8.0 \rightarrow 14.5$  MeV; also  $n_0$ ), (1978NO04;  $8.1 \rightarrow 9.0$  MeV) and (1976GL11;  $9 \rightarrow 15$  MeV; also  $n_0$ ). For the earlier measurements see (1959AJ76, 1970AJ04, 1976AJ04, 1976GAYV).

Observed resonances are displayed in Tables 13.12 and 13.13. The parameters of the resonances with  $E_n > 6.3$  MeV are poorly known.

Polarization measurements have recently been reported at 4.60, 4.82, 5.17 MeV (1979WE1E, 1979WEZP;  $n_0$ ), 14.2 MeV (1976BR1J, 1976CA13;  $n_0, n_1$ ) and 15.85 MeV (1976LE1M, 1976TH1B;  $n_0, n_1$ ). For the earlier work see Table 13.15 in (1976AJ04). For reaction (c) see (1976CO1N) and  $^{12}\text{C}$  in (1980AJ01). See also (1975BL07, 1976HA1N, 1976TO1C, 1978ME12, 1978SU1E, 1979BE50, 1979FI1B, 1979LAZP, 1979LAZQ, 1979URZZ, 1980LA1D), (1975HO1F, 1976KI1F, 1976LI1H, 1976WA1B, 1976WA1C, 1977LA1H), (1977SM1D; applied) and (1976TH10, 1977PU02, 1978AD1A, 1978CA03, 1978MI1E, 1978MI04, 1979RO1E, 1980SH01; theor.).

31. $^{12}\text{C}(\text{n}, 2\text{n})^{11}\text{C}$	$Q_m = -18.721$	$E_b = 4.94639$

<sup>a</sup> See Tables 13.10 in (1970AJ04) and 13.16 in (1976AJ04) for references. See also (1973MU14).

<sup>b</sup>  $\gamma_n^2 = 540$  keV, radius = 4.80 fm (1970ME1C: single bound state + hard sphere scattering).

<sup>c</sup> See also Table 1 in (1973DA17).

<sup>d</sup>  $\Gamma_n$  for  $^{13}\text{C}^*(7.69, 8.2, 8.86)$  are reported to be 170, 1110 and 170 keV, respectively (1980HO11;  $^{13}\text{C}(\gamma, n_0)$ ).

<sup>e</sup> Derived from a lorentzian probability plot (1980CI03).

Table 13.13: Resonances in  $^{12}\text{C}(\text{n}, \text{n}'\gamma_{4.4})^{12}\text{C}$  <sup>a</sup>

$E_{\text{n}}$ (MeV)	$\Gamma_{\text{c.m.}}$ (keV)	$E_{\text{x}}$ in $^{13}\text{C}$ (MeV)
4.96	< 80	9.52
5.42	< 80	9.95
5.98	200	10.46
6.35	120	10.80
6.57	< 80	11.01
6.65	< 80	11.08
7.50	260	11.86
7.81	180	12.15
8.14	220	12.45
9.31	500	13.53
15.8	$\approx 450$	19.5
$\approx 19$		22.5 <sup>b</sup>

<sup>a</sup> The first ten resonances are from (1959HA13), the two highest are reported by (1968BO34).

<sup>b</sup> See, however, (1970DE14).

The cross section exhibits a weak resonance corresponding to  $E_{\text{x}} \approx 20.5$  MeV and a stronger structure at  $E_{\text{x}} \approx 21.5$  MeV: see (1976AJ04). Polarization measurements are reported at  $E_{\bar{\text{n}}} = 50$  MeV (1977FI1B). See also  $^{12}\text{B}$  in (1980AJ01) and (1974BO1E, 1975NI1C, 1976GAYV, 1976SL2A, 1979ROZV).

$$\begin{array}{lll} 33. (\text{a}) ^{12}\text{C}(\text{n}, \text{d})^{11}\text{B} & Q_{\text{m}} = -13.7323 & E_{\text{b}} = 4.94639 \\ (\text{b}) ^{12}\text{C}(\text{n}, \text{t})^{10}\text{B} & Q_{\text{m}} = -18.9302 & \end{array}$$

For reaction (a) see (1976AJ04). For reaction (b) see (1978QA01). For both see (1976GAYV, 1976SL2A).

$$34. ^{12}\text{C}(\text{n}, \alpha)^9\text{Be} \quad Q_{\text{m}} = -5.7015 \quad E_{\text{b}} = 4.94639$$

The cross section for the  $\alpha_0$  group shows a broad structure at  $E_{\text{n}} \approx 8$  MeV (1963DA12). See also (1978SU1D) and (1976AJ04, 1976GAYV, 1976SL2A).

At  $E_p = 185$  MeV, angular distributions have been observed for the  $\pi^+$  groups to the ground state of  $^{13}\text{C}$  and to  $E_x = 3.08 \pm 0.09, 3.80 \pm 0.12, 6.87 \pm 0.18, 7.57 \pm 0.16$  and  $9.51 \pm 0.22$  MeV. The shapes of the distributions and the differential cross sections to the various states are quite different: several kinds of reaction processes appear to be involved ([1973DA24](#)). Polarization measurements are reported at  $E_{\bar{p}} = 200$  MeV to  $^{13}\text{C}^*(0, 3.09 + 3.68 + 3.85)$  ([1978AU07](#))<sup>†</sup>. See also ([1979PIZZ](#), [1979SOZY](#), [1979TSZZ](#)), ([1975HU1D](#), [1976AJ04](#)), ([1976MI14](#), [1976NO1D](#), [1977KU1G](#), [1977LE1H](#), [1978WE1G](#), [1979CE1A](#); theor.) and the “*Pion capture and reactions*” section here.

Measurements of the proton groups are summarized in Table [13.14](#). Angular distributions have been studied at many energies to  $E_d = 80.2$  MeV: see Table 13.19 in ([1976AJ04](#)) for a listing of earlier work and ([1979OS11](#);  $E_d = 1.58 \rightarrow 2.20$  MeV;  $p_1$ ). Observed  $\gamma$ -rays are listed in Table 13.16 of ([1970AJ04](#)) and in Table [13.6](#) here: ground state decays have been observed for  $^{13}\text{C}^*(3.09, 3.68, 3.85)$ .  $^{13}\text{C}^*(3.68)$  decays via  $^{13}\text{C}^*(3.09)$  with a  $0.75 \pm 0.04\%$  branch ([1980WA24](#)).  $^{13}\text{C}^*(3.85)$  also decays via  $^{13}\text{C}^*(3.68)$  with a  $36.0 \pm 0.7\%$  branch ([1975TR07](#)),  $36.3 \pm 0.6\%$  ([1980WA24](#)) with  $E_\gamma = 169.300 \pm 0.004$  keV ([1980WA24](#)) and via  $^{13}\text{C}^*(3.09)$  with a  $1.20 \pm 0.04\%$  branch ([1980WA24](#)). Mixing ratios are given in ([1970AJ04](#)). Lifetimes of the first three excited states are displayed in Table [13.5](#): see ([1976AJ04](#)) and ([1977HE1D](#), [1977HE12](#)). The nuclear  $g$  factor of  $^{13}\text{C}^*(3.85)$  is  $0.59 \pm 0.05$  ([1974BE48](#)).

Reaction (b) has been studied in a kinematically complete experiment at  $E_d = 5.00$  to  $9.85$  MeV: there is some evidence for p-n final state interaction ([1973SA03](#)). See also ([1966YO1A](#), [1976DY05](#), [1979SI07](#)), ([1976EP1A](#); astrophys.), ([1977FI1A](#), [1978BO1L](#); applied), ([1976HE17](#), [1976OS07](#), [1976SE1F](#), [1976SH13](#), [1976TA1D](#), [1977AN1G](#), [1977TA08](#), [1978HA1Q](#), [1979NE1B](#), [1979ZE1B](#); theor.) and  $^{14}\text{N}$ .

At  $E_t = 12$  MeV angular distributions have been studied for the  $d_0 \rightarrow d_3$  groups ([1966GL01](#)).

<sup>†</sup> For cross section measurements near threshold see ([1979MA38](#), [1979MA39](#)).

<sup>e</sup>  $\Gamma_{\text{d,p}}/\Gamma_n = 0.68, 0.91$  and  $2.2$  for  $^{13}\text{C}^*(8.2, 8.86, 9.90)$ , respectively (1973DA17).

<sup>f</sup> Nominal energies (1973DA17).

<sup>g</sup> From  $E_\gamma$  measurements (1980WA24). See also (1975TR07).

The angular distributions for the transitions to  $^{13}\text{C}^*(0, 3.85)$  have been studied at  $E(^3\text{He}) = 40$  MeV ([1971ST21](#)). The proton decay of various  $^{14}\text{N}$  states to  $^{13}\text{C}_{\text{g.s.}}$  has been studied by ([1974NO01](#)): see  $^{14}\text{N}$ .

Angular distributions of the  $^3\text{He}$  particles have been measured at  $E_\alpha = 56$  MeV ([1969GA11](#); to  $^{13}\text{C}^*(0, 3.68 + 3.85)$ ), 104 MeV ([1972HA08](#); to  $^{13}\text{C}(0)$ ) and 139 MeV ([1973SM03](#); to  $^{13}\text{C}^*(0, 3.85)$ ). A detailed comparison has been made between the angular distributions of the ground state  $^3\text{He}$  particles and of the tritons from the mirror reaction  $^{12}\text{C}(\alpha, t)^{13}\text{N}$  ([1969GA11](#), [1972HA08](#)).

Angular distributions at  $E(^7\text{Li}) = 48$  MeV to  $^{13}\text{C}^*(0, 3.09, 3.68, 3.85)$  have been analyzed and yield spectroscopic factors of 0.80, 0.44, 0.17 and 0.74 for the first four states of  $^{13}\text{C}$  ([1979ZE01](#)). See ([1973SC26](#)) for earlier work at  $E(^7\text{Li}) = 36$  MeV.

See ([1974AN36](#)) and ([1976AJ04](#)).

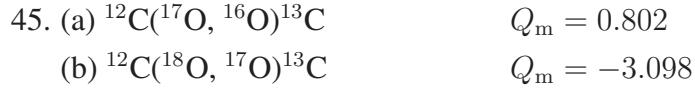

Angular distributions at  $E(^{12}\text{C}) = 93.8$  MeV have been measured for the transitions to  $^{13}\text{C}^*(0, 3.85)$  ([1979FU04](#)). See also ([1979HEZX](#)) and ([1976AJ04](#)).

Angular distributions have been reported at  $E(^{14}\text{N}) = 78, 100$  and  $154.8$  MeV involving  $^{13}\text{C}^*(0, 3.85)$  [and at 100 MeV  $^{13}\text{C}^*(3.09, 7.3 \pm 0.3)$ ]: see ([1976AJ04](#)) and ([1976NA09](#)). More recently angular distributions have been studied at  $E(^{14}\text{N}) = 28, 32, 34$  and  $36$  MeV ([1976BA16](#)). The ratio of the differential cross section to  $^{13}\text{C}_{\text{g.s.}}$  and that to  $^{13}\text{N}_{\text{g.s.}}$  (observed via  $^{12}\text{C}(^{14}\text{N}, ^{13}\text{C})^{13}\text{N}$ ), as a function of  $\theta$  is approximately 1 as expected if mirror symmetry holds ([1969VO01](#), [1970VO02](#), [1975VO05](#)). See also ([1978MA1F](#)) and ([1977WE1H](#), [1978DZ1A](#), [1978NA15](#), [1978WE1F](#), [1979DO13](#); theor.).

Angular distributions are reported at  $E(^{16}\text{O}) = 128$  MeV to  $^{13}\text{C}^*(0, 3.85)$  ([1979PR07](#)).

Angular distributions have been studied at  $E(^{17}\text{O}) = 30.5$  and  $33.8$  MeV (to  $^{13}\text{C}^*(0, 3.09)$ ) and at  $E(^{18}\text{O}) = 32.3$  and  $35$  MeV (to  $^{13}\text{C}_{\text{g.s.}}$ ) ([1978CH16](#)).

See ([1970AJ04](#)).

See  $^{13}\text{B}$  and Table [13.2](#).

For  $\tau_m$  studied by resonance scattering see Table [13.5](#).

The main features of the cross section are a sharp peak corresponding to the  $T = \frac{3}{2}$  state  $^{13}\text{C}^*(15.11)$  [ $\Gamma_{\gamma_0} = 19.7 \pm 2.0$  eV], the broad pigmy resonance at  $E_x = 13$  MeV [on which peaks are superimposed at  $E_x = 11.0, 13.8, 16.5$  and  $17.8$  MeV] and the giant resonance at  $E_x = 24$  MeV ( $\sigma_{\text{max}} = 9.5$  mb) [surrounded by shoulder resonances at  $E_x = 20.8$  and  $\approx 30$  MeV, both of which appear to decay substantially to highly excited states of  $^{12}\text{C}$ ]. There is also some evidence for a weak resonance at  $\approx 37$  MeV superimposed on the high energy tail of the GDR ([1979JU01](#): monoenergetic photons). A recent study of the angular distributions of  $n_0$  suggests states at  $E_x = 7.70 (\frac{3}{2}^+), 7.95 (\frac{3}{2}^+), 8.95 ((\frac{1}{2}^-)), 10.0 ((\frac{3}{2}^-)), 11.0 ((\frac{1}{2}^+))$  and  $12.05$  MeV  $((\frac{3}{2}^+))$  ([1979WO06](#)).  $\Gamma_n$  and  $\Gamma_{\gamma_0}$  deduced from  $(\gamma, n_0)$  measurements are displayed in Tables [13.12](#) and

Table 13.15: Electromagnetic transitions <sup>a</sup> in  $^{13}\text{C}$  from  $^{13}\text{C}(\text{e}, \text{e}')^{13}\text{C}$  <sup>b</sup>

<sup>b</sup> (1969WI22, 1970WI04). (1978SO1B, 1979CR1C, 1979CRZZ) also report the population of  $^{13}\text{C}^*(3.85, 9.50)$ .

<sup>c</sup> Monopole matrix element in fm<sup>2</sup>.

<sup>d</sup>  $\Gamma = 190 \pm 35$  keV.

<sup>e</sup> 0.11 ± 0.015 eV (1980HO11;  $^{13}\text{C}(\gamma, \text{n})$ ).

<sup>f</sup> 5.4 ± 0.5 eV (1980HO11);  $\Gamma_{\gamma_0}$  for  $^{13}\text{C}^*(7.69, 8.2)$  are reported to be 0.6 ± 0.1 and 7.0 ± 0.9 eV, respectively (1980HO11).

<sup>g</sup> Observed by (1980SO1B).

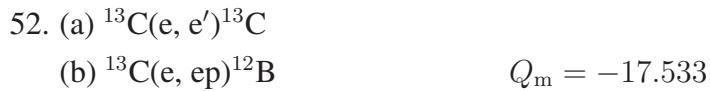

**13.15 (1980HO11).** For other differential cross section measurements derived from bremsstrahlung measurements see (1977WO04;  $n_0$ , 6.0 to 37 MeV;  $n_1$ , 10.5 to 35.5 MeV). For reports of other structures see (1976AJ04) and (1976KO22). See also (1977AL18; theor.). For reaction (b) see (1979JU01) and (1976AJ04). See also (1976BE1H, 1976CR1C), (1977DA1B, 1979BE1X) and (1977HO32, 1977MA06, 1979HO17, 1979JOZP; theor.).

(1964DE12) report structures at  $E_\gamma = 18.5, 20.0, 23.5, 26.0$  and  $29.0$  MeV. The main part of the cross section is in the 23.5 MeV peak which has  $\Gamma \approx 3$  MeV. A broad maximum near 25.5 MeV has been reported by (1956CO72, 1957CO57). The cross section to  $^{12}\text{B}^*(0.95)$  shows a broad maximum at  $E_\gamma = 25$  MeV (1975PA09). See also (1977HO32, 1977MA06, 1979HO17; theor.).

See (1970AJ04).

The elastic scattering has been studied for  $E_e = 120$  to  $750$  MeV (1970HE24). A number of inelastic groups are seen: see Tables 13.15 and 13.16 (1970WI04, 1971BE51, 1980SO1B). A distinct splitting of the giant resonance into two large peaks near  $E_x = 20.5$  and  $24.5$  MeV, with widths of  $\approx 3$  and  $\approx 4$  MeV, respectively, is observed. It is suggested that these are groupings of narrower peaks [see Table 13.16]. The  $E_x = 20.5$  and  $24.5$  MeV resonances are probably  $T = \frac{1}{2}$  and  $T = \frac{3}{2}$ , although the 4 MeV splitting is somewhat smaller than expected (1971BE51). See also reactions 49 and 50. For radius measurements see (1976AJ04) and the “GENERAL” section here. See also (1977AL1H, 1977AL1J, 1979KI1J, 1979SE06, 1980ER01; theor.).

At  $E_e = 43$  MeV the energy and angular distributions of the protons emitted in reaction (b) suggest the involvement of  $^{13}\text{C}^*(21.8?, 24.2, 25.5, 27.5, 31.5)$  (1971SH09).

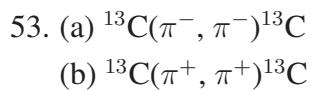

Table 13.16: States of  $^{13}\text{C}$  from  $^{13}\text{C}(\text{e}, \text{e}')^{13}\text{C}^*$  ([1980SO1B](#))<sup>a</sup>

( $16.183 \pm 28$ )	( $40 \pm 20$ )	( $29.4$ )	$1200$
( $18.497 \pm 10$ )	( $91 \pm 23$ )		

<sup>a</sup>  $E_e = 165.8, 221.5$  and  $276.8$  MeV. See also Tables [13.4](#) and [13.15](#).

<sup>b</sup> Data are consistent with  $J^\pi = \frac{9}{2}^+$ .

<sup>c</sup> ([1971BE34](#)).

The elastic scattering of  $\pi^+$  has been studied at  $E_{\pi^+} = 48.6$  MeV by ([1978DY01](#)). At  $E_\pi = 162$  MeV the inelastic transition to  $^{13}\text{C}^*(9.5)$  is very strongly enhanced in  $\pi^-$  scattering. The enhancement factor  $\sigma(\pi^-)/\sigma(\pi^+) \approx 9$  is consistent with a pure neutron transition and a  $\frac{9}{2}^+$  assignment. Also enhanced in  $\pi^-$  scattering (but less strongly) are  $^{13}\text{C}^*(0, 3.09, 3.68 + 3.85), (7.49)$ ,  $^{13}\text{C}^*(7.55)$  and a group of states close to 16 MeV are enhanced in  $\pi^+$  scattering. The centroid of a group of states near 22 MeV is found in  $(\pi^-, \pi'^-)$  at a higher excitation energy than in  $(\pi^+, \pi'^+)$  ([1979DE34](#)). At  $E_\pi = 180$  MeV angular distributions are reported for the transitions to  $^{13}\text{C}^*(0, 3.68, 7.55, 9.5, 11.7, 15.0, 17.5)$ : the transitions to  $^{13}\text{C}^*(9.5)$  is enhanced by a factor of  $4.0^{+2.0}_{-0.7}$  ([1979SC25](#)) in  $\pi^-$  scattering. Preliminary work is also reported for the inelastic scattering to  $^{13}\text{C}^*(16.1, 21.4)$  [large M4 strength] ([1980TR1B](#)). See also teh “GENERAL” section here.

#### 54. $^{13}\text{C}(\text{n}, \text{n})^{13}\text{C}$

Angular distributions have been measured at  $E_n = 1.6$  to  $6.6$  MeV for the  $n_0$  group, and for the  $n_1, n_2$  and  $n_3$  groups at several energies in that range ([1978LA1H](#), [1979KOZU](#); abstracts). See also ([1977NO07](#); theor.) and  $^{14}\text{C}$ .

#### 55. (a) $^{13}\text{C}(\text{p}, \text{p})^{13}\text{C}$

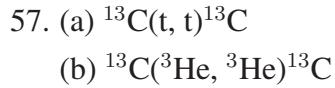

Angular distributions have been studied at  $E_p = 1.37$  to  $30.4$  MeV [see ([1976AJ04](#))] and at  $E_p = 6$  MeV ([1975DE26](#), [1977SA1B](#);  $p_0, p_1, p_3$ ),  $E_{\bar{p}} = 10.0$  to  $17.5$  MeV ([1978WE13](#);  $p_0$ ),  $E_p = 35.2$  MeV ([1980FA07](#);  $p_0$ ),  $135$  MeV ([1980RI1A](#); to  $^{13}\text{C}^*(9.50)$ ),  $800$  MeV ([1978BL02](#); to  $^{13}\text{C}^*(0, 3.09, 3.68, 6.86, 7.55, 11.92 \pm 0.06)$ ) and  $1$  GeV ([1979AL26](#);  $p_0$ ). The work of ([1978BL02](#)) suggests  $J^\pi = (\frac{5}{2}, \frac{7}{2})^+$  for  $^{13}\text{C}^*(11.92)$ . Inelastic scattering to  $^{13}\text{C}^*(21.3, 21.8)$ , the former with  $\Gamma \approx 0.3$  MeV [may be due to unresolved states] is observed at  $E_p = 135$  MeV ([1980DE1L](#); prelim.). Microscopic analyses of the angular distribution to  $^{13}\text{C}^*(9.50)$  [ $J^\pi = \frac{9}{2}^+$ ] show that the transition is an essentially pure  $1p_{3/2}$  to  $1d_{5/2}$  neutron transition with a total angular momentum transfer of 4, consistent with the results of the pion scattering (see reaction 53) ([1980RI1A](#)).

Reaction (b) has been studied at  $E_p = 7.9$  to  $12$  MeV ([1971OT02](#): one or more of the  $^{13}\text{C}$  states at  $7.5$  MeV seem to be involved) and at  $E_p = 46$  MeV ([1974MI05](#)). See also  $^{14}\text{N}$ , ([1977BA2G](#), [1978AL36](#)) and ([1977AM1C](#); theor.).

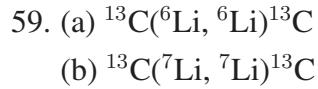

Angular distributions have been measured at  $E_d = 0.71$  to  $15$  MeV [see ([1976AJ04](#))] and at  $E_{\bar{d}} = 13$  MeV ([1978DA17](#);  $d_0 \rightarrow d_3$ ) and  $E_d = 13.6$  MeV ([1975ZA08](#);  $d_0$ ). See also  $^{15}\text{N}$  and ([1979DO03](#); theor.).

For reaction (a) see ([1980DE1M](#)). Angular distributions of elastically scattered  ${}^3\text{He}$  have been studied at  $E({}^3\text{He}) = 12$  to  $40$  MeV [see ([1976AJ04](#))], at  $18, 20$  and  $24$  MeV ([1976MA26](#)), at  $20$  MeV ([1977PE23](#)) and at  $41$  MeV ([1980TR02](#)). Angular distributions at  $E({}^3\text{He}) = 40$  MeV have also been reported to  $^{13}\text{C}$  states at  $E_x = 3.09, 3.68, 3.85, 6.86, 7.55 \pm 0.03, 8.86 \pm 0.03$  and  $11.84 \pm 0.03$  MeV.  ${}^3\text{He}$  groups to  $^{13}\text{C}^*(9.50 \pm 0.03)$  and (15.11) are also reported: the latter is weak ([1969BA06](#)). At  $E({}^3\text{He}) = 43.6$  MeV angular distributions to  $^{13}\text{C}^*(9.498)$  and to  $^{13}\text{N}^*(8.918)$  [ $J^\pi = \frac{1}{2}^-$ ] (in the  $({}^3\text{He}, \text{t})$  reaction) are identical but the cross section in the latter reaction is  $1.25 \pm 0.15$ , rather than the factor of 2 expected from isospin symmetry ([1980PE1E](#); prelim.). See also ([1980DE1M](#)) and ([1977FU1G](#), [1977FU1H](#); theor.).

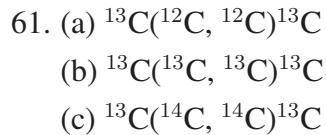

Elastic angular distributions have been measured at  $E_\alpha = 15$  to 40.5 MeV. In the range  $E_\alpha = 24$  to 40.5 MeV angular distributions have been reported to  $^{13}\text{C}^*(3.09, 3.68 + 3.85, 6.86, 7.5)$ . At  $E_\alpha = 22$  MeV,  $E_x = 7686$  keV,  $\Gamma_{\text{cm}} = 70 \pm 5$  keV ([1980FU04](#); also line shapes). ([1976WO11](#)) report  $S_\alpha = 0.67$  for  $^{12}\text{C}_{\text{g.s.}}$ . The excitation of  $^4\text{He}^*(20.1)$  [ $J^\pi = 0^+$ ] has been studied at  $E_\alpha = 65$  MeV ([1976JA17](#)). See also ([1976PA25](#), [1977DM1A](#), [1977SA19](#), [1978ZE03](#); theor.).

Angular distributions of elastically scattered Li ions have been studied at  $E(\text{Li}) = 4.5$  to 34 MeV [see ([1976AJ04](#))], at  $E(\overline{\text{Li}}) = 9$  MeV ([1978DR07](#)) and at  $E(^6\text{Li}) = 40$  MeV ([1979ZE01](#)). See also ([1971SC21](#)) and ([1976ST22](#), [1979SU1F](#); theor.).

The elastic scattering has been studied at  $E(^{13}\text{C}) = 28.1$  and 36.2 MeV ([1979JA04](#), [1979UN01](#)).

Angular distributions for reaction (a) have been studied at  $E(^{12}\text{C}) = 10$  to 87 MeV [see ([1976AJ04](#))], 15 MeV ([1980VO05](#); elastic, and to  $^{13}\text{C}^*(3.09, 3.85)$ ), 20 to 35.5 MeV ([1978CH29](#); elastic, and to  $^{13}\text{C}^*(3.09, 3.68 + 3.85)$  from 30 MeV), 80 MeV ([1979TA1E](#); elastic), and for the elastic scattering at  $E(^{13}\text{C}) = 12$  MeV ([1976WE28](#), [1977GU07](#)) and 36 MeV ([1976WE21](#)). The spectroscopic factor for  $^{13}\text{C}_{\text{g.s.}} = 0.81 \pm 0.04$  ([1977GU07](#)). For fusion studies see ([1976ST12](#), [1979KO20](#)). See also  $^{12}\text{C}$  in ([1980AJ01](#)), ([1978LE1N](#)), ([1977WI1C](#)), ([1978RO1D](#); astrophys.) and ([1977TR1A](#), [1978AV1A](#), [1978CH30](#), [1978PA1B](#), [1978TA1B](#), [1979IM02](#), [1979GR20](#), [1979ZE1B](#); theor.).

For reaction (b) elastic angular distributions have been measured at  $E(^{13}\text{C}) = 15$  to 24 MeV ([1973HE12](#)), while for reaction (c) the elastic distribution has been measured at  $E(^{13}\text{C}) = 15$  MeV ([1972BO68](#)). For a fusion study see ([1980CH01](#)). See also ([1978TE02](#), [1980SC1D](#); theor.).

The elastic angular distribution has been studied at  $E(^{14}\text{N}) = 19.3$  MeV ([1971VO01](#)). See also ([1976AJ04](#)) and ([1980WI09](#)) for fusion measurements.

63. (a)  $^{13}\text{C}(^{16}\text{O}, ^{16}\text{O})^{13}\text{C}$   
(b)  $^{13}\text{C}(^{17}\text{O}, ^{17}\text{O})^{13}\text{C}$   
(c)  $^{13}\text{C}(^{18}\text{O}, ^{18}\text{O})^{13}\text{C}$

Elastic angular distributions have been measured for reaction (a) at  $E(^{16}\text{O}) = 10$  to 30 MeV [see ([1976AJ04](#))] and 14 MeV ([1976DU04](#)), and at  $E(^{13}\text{C}) = 36$  MeV ([1976WE21](#)) and 105 MeV ([1979BR03](#)). For fusion measurements see ([1979CH07](#)). Elastic scattering distributions in reaction (b) are reported at  $E(^{17}\text{O}) = 29.8$  and 32.3 MeV ([1977CH22](#), [1978CH03](#); see also  $^{17}\text{O}$  in ([1982AJ01](#))). For fusion syudies see ([1980WI09](#)). Elastic scattering in reaction (c) has been studied at  $E(^{18}\text{O}) = 15$ , 20 and 24 MeV ([1971KN05](#)) and 31 MeV ([1978CH03](#)). For a fusion study see ([1978CO07](#)). See also ([1979GAZV](#)) and ([1978SC1E](#), [1979PAZY](#); theor.).

64.  $^{13}\text{C}(^{24}\text{Mg}, ^{24}\text{Mg})^{13}\text{C}$

See ([1979DU10](#)).

65.  $^{13}\text{C}(^{28}\text{Si}, ^{28}\text{Si})^{13}\text{C}$

Backward elastic angular distributions are reported at  $E(^{28}\text{Si}) = 77.6$  to 94.6 MeV ([1979OS01](#)). See also ([1975RA33](#), [1979DE1N](#)).

66.  $^{13}\text{C}(^{32}\text{S}, ^{32}\text{S})^{13}\text{C}$

See ([1975RA33](#)).

67. (a)  $^{13}\text{C}(^{40}\text{Ca}, ^{40}\text{Ca})^{13}\text{C}$   
(b)  $^{13}\text{C}(^{48}\text{Ca}, ^{48}\text{Ca})^{13}\text{C}$

See ([1978HO1C](#)) and ([1977FU1K](#), [1977UD1A](#), [1978BA26](#), [1978PE1E](#), [1979SA27](#); theor.).

See  $^{13}\text{N}$ .

Angular distributions have been measured at  $E_p = 12$  to  $18.5$  MeV [see ([1976AJ04](#))] and at  $27$  MeV ([1975CE04](#);  $d_0 \rightarrow d_3$ ). The spectroscopic factors for the first four states of  $^{13}\text{C}$  are  $1.4$ ,  $0.02$ ,  $1.8$  and  $0.13$ , respectively ([1975CE04](#)).

Angular distributions for  $t_0 \rightarrow t_3$  have been studied at  $E_d = 12$  MeV ([1966GL01](#)) and  $E_{\bar{d}} = 14$  MeV ([1976WE01](#)). The spectroscopic factors for  $^{13}\text{C}^*(0, 3.09, 3.68, 3.85)$  are  $1.00$ ,  $0.06$ ,  $1.0$  and  $0.08$ , respectively ([1976WE01](#)). See also  $^{16}\text{N}$  in ([1982AJ01](#)).

Angular distributions have been measured at  $E(^3\text{He}) = 3$  to  $4.5$  MeV ( $\alpha_0, \alpha_1$ ) and  $3$  to  $6.6$  MeV ( $\alpha_2, \alpha_3$ ) ([1972KE08](#)), at  $6, 8$  and  $10$  MeV ([1971CO14](#);  $\alpha_0$ ) and  $44.8$  MeV ([1966BA13](#);  $\alpha_0, \alpha_2$  and  $\alpha$  to  $^{13}\text{C}^*(15.11)$ ). See also  $^{17}\text{O}$ .

See ([1976AJ04](#)).

See ([1976AJ04](#)).

See ([1976AJ04](#)).

Angular distributions have been measured at  $E(^{16}\text{O}) = 20, 25$  and  $30$  MeV ([1975SC35](#), [1975SC42](#)): they are well described by DWBA (fixed range approximation). See also ([1977GO1D](#), [1977WE1H](#); theor.).

See ([1976AJ04](#)).

For  $E_{\text{bs}} = 15.5$  to  $29.5$  MeV a large fraction of the neutron yield appears to be associated with sequential decay to  $^{12}\text{C}$  via  $^{13}\text{C}^*(7.75, 8.86, 11.80)$  ([1972GE11](#), [1970SH06](#)). Angular distributions measured in the giant resonance region of  $^{14}\text{N}$  are consistent with the proton decay of  $(\text{p}_{1/2})^{-1}(2\text{s}1\text{d})$  giant dipole states to  $^{13}\text{C}_{\text{g.s.}}$  and of  $(\text{p}_{3/2})^{-1}(2\text{s}1\text{d})$  states to  $^{13}\text{C}^*(3.68)$  ([1974BA37](#)). The population of  $^{13}\text{C}^*(3.09, 3.85)$  has also been reported ([1970TH01](#);  $E_{\text{bs}} = 29$  MeV). See also  $^{14}\text{N}$ .

Angular distributions of  $d_0$  have been determined at  $E_n = 14.1$  to  $14.7$  MeV: see ([1970AJ04](#)). Differential cross sections for formation of  $^{13}\text{C}^*(3.09, 3.68)$  have been measured for  $E_n = 10.1$  to  $11.0$  MeV ([1970DI1A](#)). See also  $^{15}\text{N}$  and ([1976KI1D](#), [1978NE1B](#)).

For reaction (a) see ([1969BA1F](#)). At  $E_p = 46$  MeV, the summed proton spectrum shows transitions to  $^{13}\text{C}^*(0, 3.68, 7.5, 11.9)$  ([1970WE09](#)). See also ([1976AJ04](#)) and ([1977KO1P](#), [1979MA20](#); theor.).

At  $E_d = 52$  MeV, angular distributions have been measured for the  ${}^3\text{He}$  particles to  ${}^{13}\text{C}^*(0, 3.09, 3.68, 7.5, 8.86, 9.50, 11.9 \pm 0.15)$  and analyzed by DWBA:  $J^\pi = \frac{5}{2}^-, \frac{1}{2}^-, \frac{3}{2}^-$  and  $\frac{3}{2}^-$ , respectively, are assigned to  ${}^{13}\text{C}^*(7.5, 8.86, 9.50, 11.9)$  ([1968HI01](#)). As expected, angular distributions of  ${}^3\text{He}$  and of tritons (from  ${}^{14}\text{N}(\text{d}, \text{t}){}^{13}\text{N}$ ) to analog states are closely the same: this has been shown for the ground state  ${}^3\text{He}$  and triton groups ([1966DE1C](#), [1968GA13](#):  $E_d = 28.5$  MeV; ([1974LU06](#):  $E_d = 15$  MeV) and for the groups to  ${}^{13}\text{C}^*(8.9 + 9.5)$  and  ${}^{13}\text{N}^*(9.2)$  ([1968HI01](#);  $E_d = 52$  MeV). See also  ${}^{16}\text{O}$  in ([1982AJ01](#)).

Observed particle groups at  $E_t = 2.6$  MeV are displayed in Table 13.22 of ([1976AJ04](#)). See also  ${}^{16}\text{O}$  in ([1977AJ02](#)).

See  ${}^{14}\text{N}$ .

An angular distribution has been obtained at  $E({}^6\text{Li}) = 32$  MeV for the transition to  ${}^{13}\text{C}_{\text{g.s.}}$  and  ${}^7\text{Be}^*(0, 0.43)$  [for the mirror reaction see reaction 40 in  ${}^{13}\text{N}$ ]: the relative cross sections show a deviation from isospin symmetry which is attributed to Coulomb effects.  ${}^{13}\text{C}^*(3.09)$  was also populated ([1971GR44](#)).

See ([1976AJ04](#)).

See ([1979SK04](#)) and  ${}^{15}\text{N}$ .

Table 13.17: Energy levels of  $^{13}\text{C}$   
from  $^{15}\text{N}(\text{p}, ^3\text{He})^{13}\text{C}$  ([1968FL03](#))

$E_x$ in $^{13}\text{C}$ (MeV $\pm$ keV)	$J^\pi$
0	$\frac{1}{2}^-$
$3.08 \pm 20$	$\frac{1}{2}^+$
3.68 <sup>a</sup>	$\frac{3}{2}^-$
6.86 <sup>a</sup>	$\frac{5}{2}^+$
$7.55 \pm 20$	$\frac{5}{2}^-$
$8.86 \pm 60$	$\frac{1}{2}^-$
$9.52 \pm 30$	$(\frac{3}{2}^-)$
$11.09 \pm 50$	$(\frac{1}{2}^-)$
$11.80 \pm 30$	$(\frac{3}{2}^-)$
$12.40 \pm 50$	$\frac{7}{2}^-$
$15.103 \pm 45$ <sup>b</sup>	$\frac{3}{2}^-$

<sup>a</sup> Observed but  $E_x$  not determined.

<sup>b</sup> ([1966CE02](#)): see Table [13.7](#).

See ([1978BA1M](#)) and  $^{16}\text{N}$  in ([1982AJ01](#)).

87.  $^{15}\text{N}(\text{p}, ^3\text{He})^{13}\text{C}$   $Q_m = -10.6658$

At  $E_p = 43.7$  MeV  $^3\text{He}$  groups have been observed to eleven states of  $^{13}\text{C}$ : see Table [13.17](#) ([1966CE02](#), [1968FL03](#)). For a summary of the analysis see ([1976AJ04](#)). A study of both angular distributions and analyzing powers in this reaction and in the mirror ( $\text{p}, \text{t}$ ) reaction shows that DWBA generally fails to predict the analyzing powers ([1974MA12](#);  $E_{\bar{p}} = 43.8$  MeV). Angular distributions have also been measured for the  $^3\text{He}$  groups to  $^{13}\text{C}^*(0, 3.68, 7.55)$  at several energies in the range  $E_p = 24.0$  to 43.5 MeV ([1974PI05](#), [1975MI01](#)). See also  $^{16}\text{O}$  in ([1982AJ01](#)).

88.  $^{15}\text{N}(\text{d}, \alpha)^{13}\text{C}$   $Q_m = 7.6874$

For  $\alpha_0$  angular distributions see ([1970AJ04](#)).  $^{13}\text{C}^*(3.09, 3.68, 8.80)$  are also populated: see ([1976AJ04](#)).

At  $E_\alpha = 42$  MeV, the angular distribution of the  ${}^6\text{Li}$  particles to  ${}^{13}\text{C}_{\text{g.s.}}$  has been measured ([1968MI05](#)).

See ([1976AJ04](#)).

Angular distributions have been measured for  $E_{\text{n}}$  to 18.8 MeV for  $\alpha_0, \alpha_1, \alpha_{2+3}$ : see ([1970AJ04](#), [1976AJ04](#)). See also ([1976NO1F](#), [1979SUZW](#)).

At  $E_\alpha = 42$  MeV the angular distribution of the reaction involving  ${}^{13}\text{C}(0)$  and  ${}^7\text{Be}^*(0 + 0.43)$  has been measured ([1972RU03](#)).

This reaction has been studied at  $E({}^{14}\text{N}) = 76$  and 79 MeV ([1976MO03](#), [1977MO1A](#)) and 155 MeV ([1975NA15](#), [1976NA09](#)). See also ([1979MO14](#)).

At  $E({}^{17}\text{O}) = 35$  MeV angular distributions have been measured involving  ${}^{13}\text{C}_{\text{g.s.}}$  and  ${}^{20}\text{Ne}^*(0, 1.63)$  ([1977KA26](#)).

See ([1976AJ04](#)).

See ([1976AJ04](#)).

23			$\gamma, p$	13
23.3		400	$p, {}^3\text{He}$	4
23.83 $\pm$ 50		$350 \pm 50$	$p, {}^3\text{He}$	4, 13
24.4		700	$p, {}^3\text{He}$	4, 13, 14
(24.6)		120	$p, {}^3\text{He}$	4
25.6 $\pm$ 100	$(\frac{3}{2})^-$	$240 \pm 80$	$p, {}^3\text{He}$	4, 14
25.9		1000	$(n), p, d, {}^3\text{He}, \alpha$	3, 4, 7, 14
26.84			$p$	14
28			$(\gamma), p, {}^3\text{He}, (\alpha)$	2, 4, 7
(31)			$p$	14
32		$\approx 2000$	$\gamma, d, {}^3\text{He}, \alpha$	2, 5, 7, 13

<sup>a</sup> See also Table 13.7.

The  $90^\circ$  cross sections for  $\gamma_0$  and  $\gamma_{2+3}$  have been measured for  $E({}^3\text{He}) = 4.8$  to 14 MeV: no pronounced structures are observed (1972BE05). See also (1976AJ04) and (1974LO1B).

$$3. {}^{10}\text{B}({}^3\text{He}, n){}^{12}\text{N} \quad Q_m = 1.574 \quad E_b = 21.637$$

Activation cross sections have been reported for  $E({}^3\text{He}) = 1$  to 30.6 MeV: there is some evidence of broad structures. See (1976AJ04), (1974LO1B) and  ${}^{12}\text{N}$  in (1980AJ01).

<sup>e</sup>  $J \geq \frac{7}{2}$  (1966PA10).

$$4. \quad ^{10}\text{B}(^3\text{He}, p)^{12}\text{C} \quad Q_m = 19.6940 \quad E_b = 21.637$$

Observed resonances in the yields of proton groups and of 12.7 and 15.1 MeV  $\gamma$ -rays are displayed in Table 13.19. For polarization measurements see (1970AJ04) and (1976LA1F). See also (1974LO1B) and  $^{12}\text{C}$  in (1980AJ01).

$$5. \quad ^{10}\text{B}(^3\text{He}, d)^{11}\text{C} \quad Q_m = 3.197 \quad E_b = 21.637$$

Activation cross sections (1976GA27) and excitation functions have been measured for  $E(^3\text{He}) = 1$  to 19 MeV: for resonances see Table 13.19. See also (1974LO1B) and  $^{11}\text{C}$  in (1980AJ01).

$$6. \quad \begin{aligned} & (a) \quad ^{10}\text{B}(^3\text{He}, t)^{10}\text{C} \quad Q_m = -3.670 \quad E_b = 21.637 \\ & (b) \quad ^{10}\text{B}(^3\text{He}, ^3\text{He})^{10}\text{B} \end{aligned}$$

See (1976AJ04) and  $^{10}\text{B}$  and  $^{10}\text{C}$  in (1979AJ01).

Excitation functions for  $\alpha_0$  and  $\alpha_1$  have been measured for  $E(\text{He}) = 2$  to 19 MeV. Observed resonances are displayed in Table 13.19. See also (1974LO1B) and  $^9\text{B}$  in (1979AJ01).

Angular distributions have been measured for  $E_{\alpha} = 1.5$  to 4.6 MeV ( $n_0$ ) and  $\approx 4.6$  MeV ( $n_1, n_{2+3}$ ) (1973VA25), and at 18.0, 19.0 and 20.2 MeV (1976DU08;  $n_0, n_1$ ). See also  $^{14}\text{N}$  and (1976EP1A; astrophys.).

At  $E(\text{Li}) = 18$  MeV the known states of  $^{13}\text{N}$  with  $6.3 < E_x < 11.7$  MeV are observed, with the exception of  $^{13}\text{N}^*(7.9, 8.92)$ . In addition, evidence is presented for a  $^{13}\text{N}$  state at  $E_x = 9.00$  MeV with  $\Gamma_{\text{cm}} = 280 \pm 30$  keV: it is very strongly excited and its angular distribution is similar to that for  $^{13}\text{C}^*(9.50)$  in the mirror reaction ( $^6\text{Li}, \text{He}^3$ ) suggesting that these two states are analogs. Other analog assignments made on the basis of corresponding intensities in the mirror reaction are given in reaction 14 of  $^{13}\text{C}$ . The widths of  $^{13}\text{N}^*(6.89, 7.38)$  are, respectively,  $120 \pm 30$  and  $70 \pm 30$  keV (1974HO06). See also (1970AJ04).

At  $E(^{10}\text{B}) = 100$  MeV, angular distributions are reported for the transitions to  $^{13}\text{N}^*(0, 3.5, 7.4, 11.9)$  (1975NA15). See also (1976NA09, 1977MO1A) and (1976AJ04).

Neutron groups have been observed to a number of states of  $^{13}\text{N}$ : see Table 13.20. The parameters of the first  $T = \frac{3}{2}$  state at  $E_x = 15.06$  MeV are displayed in Table 13.7 where they are compared with the corresponding quantities for  $^{13}\text{C}^*(15.11)$  (1973AD02, 1975MA21, 1977MA16, 1979AD01). Angular distributions for  $n_0$  have recently been reported at  $E(\text{He}) = 1.70$  and 1.90 MeV (1979OS10) and 5.2 to 12 MeV (1977DA18). See also  $^{14}\text{N}$  and (1977OS08; theor.).

Table 13.20: States of  $^{13}\text{N}$  from  $^{11}\text{B}(\text{He}^3, \text{n})^{13}\text{N}$

<sup>a</sup> See also Table 13.26 in (1976AJ04) and (1980BA54; theor.).<sup>b</sup> Weighted mean of values from (1968RI16, 1974BL06).<sup>c</sup> (1968RI16).<sup>d</sup> See (1973ME12).<sup>e</sup> A value of  $0.30 \pm 0.05$  is assumed for  $\Gamma_{\text{p}_0}/\Gamma$ : see Table 13.22.<sup>f</sup> A value of 126 keV is taken for  $\Gamma_{\text{p}_0}$  (1969LE18).<sup>g</sup> This peak may be due to an unresolved doublet.<sup>h</sup> Giant resonance for  $\gamma_1$ .<sup>i</sup> Main dipole strength is concentrated in this peak (1976BE28).<sup>j</sup> Recalculated on basis of total  $\Gamma_{\text{lab}} = 67 \pm 4$  keV. I am indebted to Prof. F.C. Barker for his comments [see (1980BA54)].

See (1974AN36).

13. (a)  $^{12}\text{C}(\text{p}, \gamma)^{13}\text{N}$   $Q_m = 1.9434$   
 (b)  $^{12}\text{C}(\text{p}, \gamma\text{p}')^{12}\text{C}$

$$Q_0 = 1943.31 \pm 0.32 \text{ keV (1977FR20);}$$

$$Q_0 = 1944.01 \pm 0.22 \text{ keV (1977HE26).}$$

Resonances for capture radiation are displayed in Table 13.21. No resonance is observed at  $E_p = 1.73 \text{ MeV } [^{13}\text{N}^*(3.55)]$ :  $\omega\Gamma_\gamma < 0.006 \text{ eV}$  (1963YO06).

Excitation functions have been measured for  $E_p = 150$  to 2500 keV. In addition to the first two resonances, direct radiative capture is observed. In reaction (b), studied for  $E_p = 610$  to 2700 keV the capture  $\gamma$ -ray yield is dominated by a direct capture process to  $^{13}\text{N}^*(2.36)$ . The cascade decay  $^{13}\text{N}^*(3.51 \rightarrow 2.36)$  has an intensity of  $8 \pm 1\%$  (1974RO29). Extrapolating the cross section to  $E_{cm} = 25 \text{ keV}$  yields a cross section factor  $S = 1.45 \pm 0.20 \text{ keV} \cdot \text{b}$  (1974RO29). A reanalysis of the data by (1980BA54) suggests  $S = 1.54_{-0.10}^{+0.15} \text{ keV} \cdot \text{b}$ . For other discussions of astrophysical questions see (1976AJ04) and (1975ZI1A, 1976BR1H, 1976RO1Q).

At  $E_p = 14.2 \text{ MeV}$ , capture radiation from the first  $T = \frac{3}{2}$  state,  $^{12}\text{N}^*(15.06)$ , is reported: see Table 13.7 for the parameters and the decay modes of this state (1968DI04, 1975MA21, 1977MA16). The angular distributions of the  $\gamma$ -rays determine  $J = \frac{3}{2}$  for  $^{13}\text{N}^*(15.06)$  (1968DI04).

Excitation functions for  $\gamma$ -rays have also been measured at  $E_p = 8.7$  to 24.4 MeV ( $\gamma_0$ ) and 19.9 to 24.4 MeV ( $\gamma_1, \gamma_{2+3}$ ) (1976BE28) and at 16 to 37 MeV ( $\gamma_0$ ) and 23 to 37 MeV ( $\gamma_{2+3}$ ) (1976FE1C). Angular distributions of  $\gamma_0$  are reported for  $16.5 < E_p < 27.0 \text{ MeV}$  by (1980WO1A; prelim.). At  $E_p = 40$  to 100 MeV most of the  $\gamma$  strength is due to transitions to  $^{13}\text{N}^*(3.5)$ , probably to  $^{13}\text{N}^*(3.55)$  [ $J^\pi = \frac{5}{2}^+$ ] because of its single particle character. Transitions to higher states may also be indicated (1979KO05, 1979AR1G). Differential cross sections for the transitions to the ground state have been measured for  $E_{\bar{p}} = 10$  to 17 MeV. The total E2 capture cross section are  $\approx 0.2 \mu\text{b}$  and no resonance effects are observed. The E2 energy-weighted sum rule depleted over this energy range is  $(8.5 \pm 3.3)\%$  (1980HE04). The interference between the M1(E2)  $T = \frac{3}{2}$  resonance ( $^{13}\text{N}^*(15.06)$ ) and the E1 GDR has been studied by (1980SN01): the E1 capture is found to be predominantly d-wave (1980SN01). At  $E_{\bar{p}} = 28.5 \text{ MeV}$ , the capture is dominated by  $\gamma_{2+3}$  but  $\gamma_0$  and a transition to  $^{13}\text{N}^*(8.1)$  are also observed (1980BL1B).

See also reaction 14, (1976AJ04), (1976TSZZ, 1977TS1A, 1979BL1F), (1974LO1B, 1979SN1A), (1977YO1F, 1978GO1F, 1979RO12; applications) and (1977AL18, 1977BA29, 1979JOZP; theor.).

A: See references listed in Table 13.27 in (1976AJ04).

<sup>a</sup> See also Tables 13.25 in (1970AJ04) and 13.27 in (1976AJ04).

<sup>b</sup> An  $R$ -matrix analysis by (1976ME22) leads to  $E_x = 2.367, 3.501$  and  $3.547$  MeV, and  $\Gamma_{\text{cm}} = 33, 55$  and  $50$  keV for these states. (1976ME22) also find that  $^{13}\text{N}_{\text{g.s.}}$  has an appreciable effect on the low energy scattering.

<sup>c</sup> See also (1976MA55).

<sup>d</sup> A dispersion analysis leads to a spectroscopic factor of  $0.53 \pm 0.08$  for  $^{13}\text{N}_{\text{g.s.}}$  (1977ME05).

<sup>e</sup> See also (1976IK01).

<sup>f</sup> Resonance in yield of 12.7 MeV  $\gamma$ -rays (1976BE28).

5

<sup>g</sup> Resonance in yield of 15.1 MeV  $\gamma$ -rays (1976BE28).

<sup>h</sup> See however (1976BE28).

<sup>i</sup> See also (1976FE1C).

<sup>j</sup> Resonance in yield of 4.4 MeV  $\gamma$ -rays (1976FE1C).

<sup>k</sup> A  $\frac{3}{2}^+$  state is indicated in this region by the work of (1976GA27).

<sup>l</sup>  $\Gamma_{\text{p}} = 263 \pm 15$  eV (1980TH05).

Yield curves for elastic protons, protons inelastically scattered to  $^{12}\text{C}^*(4.4, 7.7, 9.6, 12.7, 15.1)$  and for  $\gamma$ -rays from  $^{12}\text{C}^*(4.4, 12.7, 15.1)$  have been studied at many energies: see Table 13.22 for a display of the characteristics of the observed structure. Recent yield measurements include those of (1976ME22;  $E_p = 0.3$  to 2.0 MeV), (1976BE28; 13.8 → 24.4 MeV (12.7 MeV  $\gamma$ ), 16.4 → 24.4 MeV (15.1 MeV  $\gamma$ )), (1976FE1C; 16 → 37 (4.4 MeV  $\gamma$ ), 16 → 31 (12.7 MeV  $\gamma$ ), 17 → 37 MeV (15.1 MeV  $\gamma$ )) and 22 to 27 MeV (1980HO07; (12.7 and 15.1 MeV  $\gamma$ )).

A phase shift analysis of the elastic scattering analyzing power for  $E_{\bar{p}} = 11.5$  to 18.1 MeV shows four  $T = \frac{1}{2}$  states with  $E_x = 14.06, 16.00, 18.16$  and 18.18 MeV, with  $J^\pi = \frac{3}{2}^+, \frac{7}{2}^+, \frac{3}{2}^+$ ,  $\frac{1}{2}^-$ : see Table 13.22 (1976ME18). At  $E_{\bar{p}} = 19.15$  to 23.34 MeV, measurements of the elastic group and the protons to  $^{12}\text{C}^*(4.4, 12.7)$  locate  $\frac{1}{2}^+$  (E1),  $\frac{5}{2}^-$  (E2) and  $\frac{7}{2}^+$  (E3) resonances below 21 MeV,  $\frac{3}{2}^+$  (E1) and  $\frac{5}{2}^-$  resonances with  $21 < E_x < 22$  MeV and  $\frac{1}{2}^+$  and  $\frac{3}{2}^+$  resonances above 22 MeV: see Table 13.22 (1979GA13). Elastic polarization measurements are also reported at  $E_{\bar{p}} = 0.45$  to 0.60 MeV (1979KR18; study of Mott-Schwinger interaction),  $E_p = 7.16$  to 7.43 MeV (1977ME06),  $E_{\bar{p}} \approx 14.2$  MeV (1980WIZW), 36.2 MeV (1978BE49), 39.9 to 75.0 MeV (1980KA02), 52.3 to 68.2 MeV (1977EG1A),  $E_p = 185$  MeV (1979IN01;  $^{12}\text{C}^*(0, 4.4, 7.7, 9.6)$ ,  $E_{\bar{p}} = 800$  MeV (1978HO05, 1978RA17) and  $E_p = 1$  GeV (1977AL25, 1980AL09). Polarization measurements involving  $^{12}\text{C}^*(4.4, 12.71, 15.11, 15.4, 16.1)$  are reported by (1978HO11) at  $E_{\bar{p}} = 50$  and 65 MeV: a marked difference in the analyzing powers for the groups to the  $1^+$  states  $^{12}\text{C}^*(12.71, 15.11)$  is observed. At  $E_{\bar{p}} = 800$  MeV analyzing powers have been measured for  $^{12}\text{C}^*(12.7, 15.1, 18.3, 19.4)$ : those to  $^{12}\text{C}^*(12.7, 18.3)$  are negative. The values of  $A_y$  appear to be characteristic of the isospin transfer (1980MO06). For other polarization measurements see (1979KA1N;  $E_{\bar{p}} = 65$  MeV;  $p_0, p_2$ ), (1979FU1H;  $E_{\bar{p}} = 24.1, 26.2, 28.0$  MeV;  $p_1$ ; measured spin flip probability), (1979BE44;  $E_{\bar{p}} = 299, 380, 483$  and 561 MeV), (1979LI03;  $^{12}\text{C}^*(4.4)$ ;  $E_{\bar{p}} = 800$  MeV), (1977NA16, 1977NA29, 1978NA18: (p, 2p);  $E_{\bar{p}} = 635$  MeV) and the older measurements [ $E_p = 0.5$  MeV to 3.6 GeV] listed in Tables 13.26 in (1970AJ04) and 13.28 in (1976AJ04). See also (1978SE01).

For total cross section measurements see (1976AJ04) and (1979SC07;  $E_p = 191$  to 550 MeV) and (1978JA16;  $E_p = 0.87$  GeV/c and 2.10 GeV/c). See also (1979DE31). For reaction (b) see  $^{11}\text{B}$  in (1980AJ01) and (1979KO21). For reaction (c) see  $^8\text{Be}$  in (1979AJ01). For reaction (d) see (1979KO36).

Bremsstrahlung measurements are reported by (1978TR05) near the  $E_p = 1.7$  MeV resonance and by (1976MA06, 1976MA55, 1977MU1C, 1979LE1G, 1979LE1H). See also (1979JA17, 1980LI01; theor.).

Inclusive cross sections have been measured by (1978FR12, 1979FR12, 1979KO21). For polarization measurements at  $E_{\bar{p}} = 316$  and 516 MeV see (1978KA08). Studies of hadron multiple production are reported by (1977AV01, 1978AR1J, 1978AZ02). Spallation measurements have been carried out by (1976RO12, 1977FO04, 1978WE1D, 1979RA20). See also (1979VD02). The production of  $\pi^+$  with  $E_{\bar{p}} = 200$  MeV (reaction (e)) is reported by (1978AU07).

See also  $^{12}\text{C}$  in (1980AJ01), (1975DE26, 1976CU08, 1976PL1C, 1976WE1E, 1976WE1F, 1976WUZZ, 1977BE1Y, 1977SA1B, 1978DE1Q, 1978GO05, 1979TR1D, 1980CO05, 1980WH1A), (1977AU1B, 1978DW1A, 1979RA1C; astophys.) and (1976AH09, 1976ES1B, 1976GO20, 1976JE1A,

1977BA29, 1976BR1L, 1977PH02, 1977WE1G, 1978AH04, 1978BA21, 1978BE66, 1978BH1B, 1978CA03, 1978CO1J, 1978FA04, 1978GR1D, 1978GU12, 1978RA20, 1978RE1D, 1978UC1A, 1978WU03, 1979AB13, 1979AM02, 1979DE1P, 1979ER02, 1979HE16, 1979LO12, 1979OS06, 1979PH05, 1979RA27, 1979RO1E, 1979TH1A, 1979WE1C, 1979YA1E, 1980AL12, 1980BR04, 1980CO06, 1980JA05, 1980RA1B; theor.).

15. (a) $^{12}\text{C}(\text{p}, \text{n})^{12}\text{N}$	$Q_m = -18.120$	$E_b = 1.9434$
(b) $^{12}\text{C}(\text{p}, \text{pn})^{11}\text{C}$	$Q_m = -18.721$	

The cross section for reaction (a) has been measured from threshold to  $E_p = 50$  MeV. Resonant structure is observed corresponding to  $E_x = 21, 24$  and , possibly  $\approx 27$  MeV (1968RI01). See also (1976RO10) and  $^{12}\text{N}$  in (1980AJ01).

Cross sections for reaction (b) have been measured to 300 GeV: see (1976AJ04). At  $E_p = 800$  MeV,  $\sigma = 32.0 \pm 1.0$  mb (1976HO19). See also (1976BE1K).

16. (a) $^{12}\text{C}(\text{p}, \text{d})^{11}\text{C}$	$Q_m = -16.497$	$E_b = 1.9434$
(b) $^{12}\text{C}(\text{p}, \text{t})^{10}\text{C}$	$Q_m = -23.364$	
(c) $^{12}\text{C}(\text{p}, ^3\text{He})^{10}\text{B}$	$Q_m = -19.6940$	

For polarization measurements [reaction (a)] see (1970AJ04) and (1977HA1N);  $E_{\bar{p}} = 27.4$  MeV;  $d_0, d_1$  and (1979HO1H);  $E_{\bar{p}} = 65$  MeV;  $d_0, d_1$ ). See also  $^{11}\text{C}$  in (1980AJ01).

Polarization measurements involving the  $t_0$  and  $t_1$  groups have been carried out at  $E_p = 49.5$  MeV (1970NE17). See also  $^{10}\text{B}$ ,  $^{10}\text{C}$  in (1979AJ01).

17. $^{12}\text{C}(\text{p}, \alpha)^9\text{B}$	$Q_m = -7.552$	$E_b = 1.9434$
---	----------------	----------------

Yield curves for  $\alpha_0$  have been measured over the 14.2 MeV resonance, corresponding to the first  $T = \frac{3}{2}$  state at  $E_x = 15.06$  MeV, and from  $E_p = 17$  to 20 MeV. The yield for the  $\alpha_1$  group has been determined for  $E_p = 17$  to 21.5 MeV. Parameters of observed resonances are displayed in Table 13.22 (1969LE18). Excitation functions for  $\alpha_0$  have also been measured for  $E_p = 18.5$  to 44 MeV at a number of angles: they exhibit structures which are typically 1 MeV broad (1971GU23). See also  $^9\text{B}$  in (1979AJ01).

18. $^{12}\text{C}(\text{p}, ^6\text{Li})^7\text{Be}$	$Q_m = -22.568$	$E_b = 1.9434$
---	-----------------	----------------

Excitation functions have been measured for  $E_p = 36$  to  $43$  MeV: no structure is apparent ([1971HO25](#)). See also ([1979RA20](#)) and  ${}^6\text{Li}$ ,  ${}^7\text{Be}$  in ([1979AJ01](#)).

19. (a) ${}^{12}\text{C}(\text{d}, \text{n}){}^{13}\text{N}$	$Q_m = -0.2812$
(b) ${}^{12}\text{C}(\text{d}, \text{pn}){}^{12}\text{C}$	$Q_m = -2.2246$

Measurements of angular distributions of neutrons are tabulated in Table 13.27 of ([1970AJ04](#)) and in ([1976AJ04](#)). Recent measurements have been reported at  $E_{\bar{d}} = 5.74$  to  $9.70$  MeV ([1976TE03](#);  $n_0, n_1$ ) and  $E_d = 13.9$  and  $15.25$  MeV ([1975AZ02](#);  $n_0, n_1, n_{2+3}$ ).

Reaction (b) is dominated at  $E_d = 5.0$  to  $6.5$  MeV and at  $9.20$  and  $9.85$  MeV by sequential decay via  ${}^{13}\text{N}^*(3.51 + 3.55)$ . At the lower energies  ${}^{13}\text{N}^*(2.36)$  participates also: see ([1976AJ04](#)) and ([1976GE20](#)). See also  ${}^{14}\text{N}$ , ([1977BA1L](#), [1979SI07](#)), ([1974LO1B](#)), ([1976LO1B](#); applications) and ([1977TR09](#), [1978BA21](#); theor.).

20. (a) ${}^{12}\text{C}({}^3\text{He}, \text{d}){}^{13}\text{N}$	$Q_m = -3.5501$
(b) ${}^{12}\text{C}({}^3\text{He}, \text{pd}){}^{12}\text{C}$	$Q_m = -5.4936$

Angular distributions have been studied to the first eight states of  ${}^{13}\text{N}$  with  $E({}^3\text{He})$  up to  $40$  MeV: see ([1970AJ04](#), [1976AJ04](#)). Recent measurements are reported at  $E({}^3\text{He}) = 25.4$  MeV ([1979SE07](#);  $d_0, d_1, d_{2+3}$ ),  $E({}^3\vec{\text{He}}) = 33.3$  MeV ([1976KA23](#);  $d_0, d_{2+3}$ ) and  $E({}^3\text{He}) = 43.6$  MeV ([1980PE13](#);  $d_0, d_1, d_{2+3}$  and  $d$  to  ${}^{13}\text{N}^*(6.36, 6.89, 7.16, 7.38, 8.0, 9.0, 10.78)$ ) and  $81.4$  MeV ([1976KO36](#);  $d$  to  ${}^{13}\text{N}^*(0, 2.36, 3.51 + 3.55, 7.16 + 7.38, 7.9, 10.36, 11.1, 12.08)$ ). See also ([1976RO1L](#)). The spectroscopic factors derived by ([1980PE13](#)) are  $S = 0.48, 0.14, 0.53, 0.007, 0.015, < 0.009, 0.024, 0.13$  and  $0.064$  for  ${}^{13}\text{N}^*(0, 2.37, 3.55, 6.36, 6.89, 7.16, 7.38, 8.0, 10.78)$ ;  $S < 0.005$  for  ${}^{13}\text{N}^*(9.0)$  and evidence is presented for its  $\frac{9}{2}^+$  character. For other values of  $S$  see ([1976KA23](#), [1976KO36](#), [1979SE07](#)). The energies and widths of the first three excited states are  $E_x = 2368.2 \pm 2.8, 3507.8 \pm 7.6$  and  $3549.2 \pm 5.0$  keV, with  $\Gamma_{\text{cm}} = 36.1 \pm 2.8, 54.8 \pm 11.5$  and  $46.5 \pm 7.1$  keV, respectively ([1974BL06](#)). Spectra obtained at  $E({}^3\text{He}) = 36$  MeV at forward angles show the broad  $d_{3/2}$  state at  $E_x = 7.9$  MeV. Interfering with it is the  $120$  keV  $\frac{3}{2}^+$  state at  $6.89$  MeV. The line shape of the  $\frac{5}{2}^+$  state at  $6.36$  MeV is said to show a pronounced interference pattern ([1979FU03](#)). For reaction (b) see ([1978MA42](#);  $E({}^3\text{He}) = 70$  and  $80$  MeV). See also ([1977BO30](#), [1977SA1L](#), [1978BA21](#); theor.) and  ${}^{15}\text{O}$ .

21. ${}^{12}\text{C}(\alpha, \text{t}){}^{13}\text{N}$	$Q_m = -17.8706$
--	------------------

Angular distributions of the  $t_0$  groups have been measured at  $E_\alpha = 56$  MeV ([1969GA11](#)) and  $104$  MeV ([1972HA08](#)).

Angular distributions have been obtained at  $E(^7\text{Li}) = 36$  MeV for the  $^6\text{He}$  ions to  $^{13}\text{N}^*(0, 3.51 + 3.55)$  ([1973SC26](#)). The spectroscopic factor for  $^{13}\text{N}_{\text{g.s.}}$  is 0.72 ([1979ZE01](#)).

See ([1976AJ04](#)).

See ([1974AN36](#)). See also ([1976AJ04](#)).

At  $E(^{12}\text{C}) = 93.8$  MeV angular distributions involving  $^{13}\text{N}^*(0, 3.51 + 3.55)$  and various  $^{11}\text{B}$  states have been measured by ([1979FU04](#)). See also ([1979HEZX](#)) and ([1976AJ04](#)).

Angular distributions involving  $^{13}\text{N}_{\text{g.s.}}$  and various  $^{13}\text{C}$  states [see reaction 43 in  $^{13}\text{C}$ ] have been studied at  $E(^{14}\text{N}) = 28$  to 155 MeV: see ([1976AJ04](#)) and ([1976BA16](#), [1976NA09](#)). See also ([1978MA1F](#)) and ([1977WE1H](#), [1978DZ1A](#), [1978NA15](#), [1978WE1F](#), [1979DO13](#); theor.).

At  $E(^{16}\text{O}) = 128$  MeV angular distributions are reported to  $^{13}\text{N}^*(0, 2.36, 3.55)$  ([1979PR07](#); also see for reduced widths).

See ([1979OR01](#);  $E(^{20}\text{Ne}) = 150$  to 294 MeV).

See ([1979MO1N](#)) and the “GENERAL” section here.

Angular distributions of  $n_0, n_1, n_{2+3}$  have been measured for  $E_p = 3.1$  to  $50$  MeV: see ([1970AJ04](#), [1976AJ04](#)). See also ([1978WA1D](#)). The  $0^\circ$  differential cross section for the  $n_0$  group has been measured to be  $4.5 \pm 0.7$  mb/sr at  $E_p = 120$  MeV ([1980GO07](#)). In reaction (b) at  $E_p = 7.9$  to  $12$  MeV one or both of the  $^{13}\text{N}$  states at  $E_x = 3.5$  MeV appear to be involved ([1971OT02](#)). See also ([1980BA11](#); theor.).

At  $E(^3\text{He}) = 39.6$  MeV, angular distributions have been obtained for the tritons corresponding to the ground state of  $^{13}\text{N}$  and to the excited states at  $2.36, 3.53 \pm 0.03$  (unresolved),  $6.36, 7.16, 7.38, 8.92 \pm 0.04, 11.85 + 0.04$  and  $15.06$  MeV. States at  $E_x = 9.5, 10.78 \pm 0.04$  and  $15.98 + 0.05$  MeV were also populated, the first of these weakly. The transitions to  $^{13}\text{N}^*(7.38, 8.92, 11.85, 15.06)$  are  $L = 2$  [ $J^\pi = \frac{5}{2}^-, \frac{1}{2}^-, \frac{3}{2}^-, \frac{3}{2}^-$ , respectively] ([1969BA06](#)). Angular distributions have also been reported at  $E(^3\text{He}) = 14$  MeV ([1970NU02](#);  $t_0, t_1$ ). For a comparison of the angular distribution to  $^{13}\text{N}^*(8.918)$  and  $^{13}\text{C}^*(9.498)$  at  $E(^3\text{He}) = 43.6$  MeV, see reaction 57 in  $^{13}\text{C}$  ([1980PE1E](#)).

Angular distributions have been measured at  $E(^6\text{Li}) = 31.8$  MeV ([1970CH19](#);  $^{13}\text{N}^*(0, 3.51 + 3.55)$ ). See also ([1979ZE01](#)) and ([1976AJ04](#)).

See ([1976AJ04](#)) and ([1978OS06](#); theor.).

See  $^{13}\text{O}$ .

See  $^{14}\text{N}$ .

See (1978RY02), (1977LE1J; applications) and  $^{15}\text{N}$ .

Angular distributions have been measured for deuteron groups to  $^{13}\text{N}^*(0, 2.36, 3.51 + 3.55, 7.38, 8.92, 11.88)$  at many energies up to  $E_p = 155.6$  MeV: see (1976AJ04) and by (1977GU14;  $E_p = 16.2$  and  $17.7$  MeV;  $p_0$ ) and (1979AO02;  $E_{\bar{p}} = 21$  MeV;  $p_0$ ). See also (1976WA15, 1978MA34; theor.).

Angular distributions of the tritons to  $^{13}\text{N}^*(0, 3.51, 7.38, 8.92 + (9.00) + 9.48, 11.8)$  have been obtained at  $E_d = 52$  MeV and analyzed by DWBA. The spectroscopic factors for the  $^{13}\text{N}$  states [and the mirror states reached in the  $^{14}\text{N}(\text{d}, ^3\text{He})^{13}\text{C}$  reaction] are in good agreement with theory and are additional evidence for the  $J^\pi$  assignments of  $\frac{1}{2}^-, \frac{3}{2}^-, \frac{5}{2}^-, \frac{1}{2}^-, \frac{3}{2}^-$  and  $\frac{3}{2}^-$  to these states (1968HI01). For comparisons of ( $\text{d}, \text{t}$ ) and ( $\text{d}, ^3\text{He}$ ) angular distributions see reaction 80 in  $^{13}\text{C}$ . See also  $^{16}\text{O}$  in (1982AJ01).

Alpha particle groups have been observed to the first seven excited states of  $^{13}\text{N}$ , including two at  $E_x = 7.166$  and  $7.388$  MeV (1962CL12;  $\pm 8$  keV). Angular distributions have been studied at many energies up to  $E(^3\text{He}) = 45$  MeV: see (1976AJ04) and (1971GU22; 4 to  $10.25$  MeV;  $\alpha_0, \alpha_1$ ). Reaction (b), studied at  $E(^3\text{He}) = 8$  MeV, appears to involve some states of  $^{13}\text{N}$ , possibly  $^{13}\text{N}^*(7.93, 8.92, 11.87)$  (1969HO13). See also  $^{17}\text{F}$  in (1982AJ01).

An angular distribution has been measured at  $E(^6\text{Li}) = 32$  MeV for the transition to  $^{13}\text{N}_{\text{g.s.}}$  and  $^7\text{Li}^*(0, 0.48)$ .  $^{13}\text{N}^*(2.36)$  was also populated ([1971GR44](#)). See also ([1976AJ04](#)) and reaction 83 in  $^{13}\text{C}$ .

See ([1976AJ04](#)).

See ([1976NA09](#)).

See ([1976SW02](#)). See also ([1976AJ04](#)).

At  $E_{\text{p}} = 43.7$  MeV, angular distributions have been obtained for the tritons corresponding to the ground state of  $^{13}\text{N}$  and the excited states at  $3.51 (\frac{3}{2}^-)$ ,  $6.38 \pm 0.03 (\frac{5}{2}^+)$ ,  $7.38 (\frac{5}{2}^-)$ ,  $8.93 \pm 0.05 (\frac{1}{2}^-)$ ,  $10.78 \pm 0.06 (\frac{1}{2}^-)$ ,  $11.88 \pm 0.04 (\frac{3}{2}^-)$  and  $15.06 (\frac{3}{2}^-; T = \frac{3}{2})$  MeV [ $J^\pi$  values in parentheses, as determined by DWBA analyses using intermediate-coupling wave functions to obtain the two-nucleon structure factors] ([1968FL03](#)). Detailed comparisons have been made with the ( $\text{p}, ^3\text{He}$ ) reaction to the mirror states in  $^{13}\text{C}$  ([1968FL02](#), [1968FL03](#), [1974MA12](#)): see reaction 87 in  $^{13}\text{C}$ . Angular distributions have also been measured for the triton groups to  $^{13}\text{N}^*(0, 3.51 + 3.55, 7.38)$  at several energies in the range  $E_{\text{p}} = 24.0$  to 43.5 MeV ([1974PI05](#), [1975MI01](#)). See also  $^{16}\text{O}$  in ([1982AJ01](#)).

See  $^{16}\text{O}$  in ([1982AJ01](#)).

46. (a) $^{16}\text{O}(\text{p}, \alpha)^{13}\text{N}$	$Q_m = -5.2185$
(b) $^{16}\text{O}(\text{p}, \text{p}\alpha)^{12}\text{C}$	$Q_m = -7.1620$

Angular distributions of the  $\alpha_0$ ,  $\alpha_1$  and  $\alpha_2$  groups have been measured for  $E_p$  to 54.1 MeV: see ([1970AJ04](#), [1976AJ04](#)). In addition, ([1972MA21](#)) have measured the distribution of the  $\alpha$  group to a state with  $E_x = 12.13 \pm 0.06$  MeV,  $\Gamma_{\text{cm}} \approx 300$  keV [ $J^\pi = \frac{7}{2}^-$ ] at  $E_p = 54.1$  MeV. See also ([1976AJ04](#)) and  $^{17}\text{F}$  in ([1982AJ01](#)).

47. $^{16}\text{O}(^{3}\text{He}, ^{6}\text{Li})^{13}\text{N}$	$Q_m = -9.239$
--	----------------

Angular distributions have been studied at  $E(^3\text{He}) = 30$  and 40.7 MeV for the  $^6\text{Li}$  ions corresponding to  $^{13}\text{N}_{\text{g.s.}}$  ([1972OH01](#)).

48. $^{16}\text{O}(\alpha, ^{7}\text{Li})^{13}\text{N}$	$Q_m = -22.566$
---	-----------------

The angular distribution for the transition to  $^{13}\text{N}_{\text{g.s.}} + ^7\text{Li}_{\text{g.s.}+0.48}$  has been measured at  $E_\alpha = 42$  MeV ([1972RU03](#)).

49. $^{16}\text{O}(^{14}\text{N}, ^{17}\text{O})^{13}\text{N}$	$Q_m = -6.409$
--	----------------

This reaction has been studied at  $E(^{14}\text{N}) = 79$  MeV ([1976MO03](#)) and 155 MeV ([1975NA15](#), [1976NA09](#)).

50. $^{18}\text{O}(\text{d}, ^{7}\text{Li})^{13}\text{N}$	$Q_m = -7.901$
---	----------------

See ([1970AJ04](#)).

51. $^{24}\text{Mg}(^{12}\text{C}, ^{23}\text{Na})^{13}\text{N}$	$Q_m = -9.747$
--	----------------

See ([1978NO02](#)).

$^{13}\text{O}$   
(Fig. 4)

## GENERAL (See also (1976AJ04).):

*Theoretical and review papers:* (1975BE56, 1976AB04, 1977CE05, 1978GU10, 1979BE1H).

*Mass of  $^{13}\text{O}$ :* From the  $Q$ -value of the  $^{16}\text{O}(^3\text{He}, ^6\text{He})^{13}\text{O}$  reaction [ $Q_0 = -30.508 \pm 0.010$  MeV] (see reaction 4) the atomic mass excess of  $^{13}\text{O}$  is determined to be  $23.108 \pm 0.010$  MeV.  $^{13}\text{O}$  is then bound with respect to  $^{12}\text{N} + \text{p}$  and  $^{11}\text{C} + 2\text{p}$  by 1.519 and 2.120 MeV, respectively.

The half-life of  $^{13}\text{O}$  is  $8.90 \pm 0.20$  msec: see (1970ES03) and (1976AJ04).  $^{13}\text{O}$  decays to a number of states of  $^{13}\text{N}$  some of which subsequently decay to  $^{12}\text{C}^*(0, 4.4)$ : see Table 13.24 (1970ES03). See also (1978RA2A) and (1977MA16, 1977RI08, 1979DE15; theor.).

At  $E_p = 613$  MeV the ground state of  $^{13}\text{O}$  and an excited state at  $E_x = 2.82 \pm 0.24$  MeV are observed in addition to unresolved structures (1978CO15) [see Fig. 4 for analogue region in  $^{13}\text{B}$ ]. See also (1979HO1F).

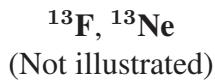

See (1979GR1K).

$$Q_0 = -30.506 \pm 0.013 \text{ (1971TR03);}$$

$Q_0 = -30.513 \pm 0.015$  (1970ME11); recalculated on basis of  ${}^9\text{C}$  mass excess of 28.912 MeV (see (1979AJ01)).

The ground state of  $^{13}\text{O}$  has been populated at  $E(^3\text{He}) = 62.6$  to  $68.6$  MeV ([1970ME11](#), [1971TR03](#)).

$^{13}\text{F}$  and  $^{13}\text{Ne}$  have not been observed. See (1975BE31; theor.).

Table 13.23: Energy levels of  $^{13}\text{O}$ 

$E_x$ (MeV)	$J^\pi; T$	$\tau_{1/2}$ (msec)	Decay	Reactions
g.s. $2.82 \pm 0.24$	$(\frac{3}{2}^-); \frac{3}{2}$	$8.90 \pm 0.20$	$\beta^+$	1, 2, 3, 4 2

 Table 13.24: Beta decay of  $^{13}\text{O}$  <sup>a</sup>

Decay to		$E_p$ (cm) (MeV) to		Relative intensity	% of all $\beta$ -decays	$\log ft$
$^{13}\text{N}^*$ (MeV)	$J^\pi$	$^{12}\text{C}^*(\text{g.s.})$	$^{12}\text{C}^*(4.4)$			
g.s.	$\frac{1}{2}^-$				$88.1 \pm 3.4$ <sup>b</sup>	$4.10 \pm 0.02$ <sup>b</sup>
3.51	$\frac{3}{2}^-$	observed		100	$10.7 \pm 3.1$	$4.52 \pm 0.13$
7.38	$\frac{5}{2}^-$	$5.48 \pm 0.05$	not seen	$0.33 \pm 0.10$	$0.40 \pm 0.19$	$5.22 \pm 0.23$
8.92	$\frac{1}{2}^-$	observed		$3.5 \pm 0.3$	$0.54 \pm 0.16$	$4.73 \pm 0.14$
			$2.56 \pm 0.05$	$1.5 \pm 0.3$		
9.48	$\frac{3}{2}^-$	observed		$0.8 \pm 0.1$	$0.13 \pm 0.04$	$5.18 \pm 0.14$
			$3.12 \pm 0.05$	$0.43 \pm 0.15$		
10.36	$\frac{5}{2}^-$	observed		$0.05 \pm 0.03$ <sup>c</sup>	$0.019 \pm 0.012$	$5.8 \pm 0.3$
			$3.97 \pm 0.05$	$0.13 \pm 0.07$		

<sup>a</sup> (1970ES03). In addition there is some evidence for weak proton groups with  $E_p = 3.44$  and  $6.28$  MeV ( $\pm 0.05$  MeV). See also (1965MC09).

<sup>b</sup> The ground state  $ft$  was taken to be 1.15 times that for  $^{13}\text{B}$  (1970ES03). (1971WI07) find  $(ft)^+/(ft)^- = 1.17 \pm 0.03$ : see reaction 1 in  $^{13}\text{B}$ .

<sup>c</sup> Calculated value from the known ratio of the elastic and inelastic widths.

## References

(Closed 01 August 1980)

References are arranged and designated by the year of publication followed by the first two letters of the first-mentioned author's name and then by two additional characters. Most of the references appear in the National Nuclear Data Center files (Nuclear Science References Database) and have NNDC key numbers. Otherwise, TUNL key numbers were assigned with the last two characters of the form 1A, 1B, etc. In response to many requests for more informative citations, we have, when possible, included up to ten authors per paper and added the authors' initials.
