

# Energy Levels of Light Nuclei

## $A = 19$

F. Ajzenberg-Selove

*University of Pennsylvania, Philadelphia, Pennsylvania 19104-6396*

**Abstract:** An evaluation of  $A = 18\text{--}20$  was published in *Nuclear Physics A475* (1987), p. 1. This version of  $A = 19$  differs from the published version in that we have corrected some errors discovered after the article went to press. Figures and introductory tables have been omitted from this manuscript. Reference key numbers have been changed to the NNDC/TUNL format.

(References closed June 1, 1987)

The original work of Fay Ajzenberg-Selove was supported by the US Department of Energy [DE-FG02-86ER40279]. Later modification by the TUNL Data Evaluation group was supported by the US Department of Energy, Office of High Energy and Nuclear Physics, under: Contract No. DEFG05-88-ER40441 (North Carolina State University); Contract No. DEFG05-91-ER40619 (Duke University).

## Table of Contents for $A = 19$

*Below is a list of links for items found within the PDF document. Figures from this evaluation have been scanned in and are available on this website or via the link below. The introductory [Table 2](#) is also available via the link.*

A. Nuclides:  $^{19}\text{He}$ ,  $^{19}\text{Li}$ ,  $^{19}\text{Be}$ ,  $^{19}\text{B}$ ,  $^{19}\text{C}$ ,  $^{19}\text{N}$ ,  $^{19}\text{O}$ ,  $^{19}\text{F}$ ,  $^{19}\text{Ne}$ ,  $^{19}\text{Na}$ ,  $^{19}\text{Mg}$ , etc.

B. Tables of Recommended Level Energies:

[Table 19.1](#): Energy levels of  $^{19}\text{O}$

[Table 19.6](#): Energy levels of  $^{19}\text{F}$

[Table 19.21](#): Energy levels of  $^{19}\text{Ne}$

C. [References](#)

D. Figures:  $^{19}\text{O}$ ,  $^{19}\text{F}$ ,  $^{19}\text{Ne}$ , [Isobar diagram](#)

E. Erratum to the Publication: [PS](#) or [PDF](#)

**$^{19}\text{He}$ ,  $^{19}\text{Li}$ ,  $^{19}\text{Be}$**   
(Not observed)

See ([1983ANZQ](#); theor.).

**$^{19}\text{B}$**   
(Not illustrated)

$^{19}\text{B}$  has been observed in the bombardment of Be by 12 MeV/A  $^{56}\text{Fe}$  ions ([1984MU27](#)). It is suggested that the atomic mass excess of  $^{19}\text{B}$  is 60.1 MeV [see ([1978AJ03](#))].  $^{19}\text{B}$  is then stable with respect to breakup into  $^{18}\text{B} + \text{n}$  by 1.8 MeV  $^{17}\text{B} + 2\text{n}$  by 0.1 MeV.  $^{19}\text{B}$  is calculated to have  $J^\pi = \frac{3}{2}^-$  and to have excited states at 1.88, 3.63 and 3.77 MeV with  $J^\pi = \frac{1}{2}^-, \frac{5}{2}^-$  and  $\frac{7}{2}^-$  ([1985PO10](#)). See also ([1986GU1D](#), [1986PO13](#)) and ([1983ANZQ](#), [1985PO10](#); theor.).

**$^{19}\text{C}$**   
(Fig. 8)

$^{19}\text{C}$  has been observed in the 0.8 GeV proton bombardment of thorium ([1986VI09](#)) and in the fragmentation of 60 MeV/A argon ions ([1987GI1E](#)). The mass excess is  $32.30 \pm 0.24$  MeV ([1986VI09](#)),  $32.95 \pm 0.42$  MeV ([1987GI1E](#)): the weighted mean is  $32.46 \pm 0.21$  MeV.  $^{19}\text{C}$  is then stable with respect to decay into  $^{18}\text{C} + \text{n}$  by 0.53 MeV and into  $^{17}\text{C} + 2\text{n}$  by 4.72 MeV. The calculated half-life of  $^{19}\text{C}$  is  $1.2 \times 10^{-2}$  sec ([1984KL06](#)). See also ([1978AJ03](#), [1985WA02](#), [1986AN07](#), [1986GU1D](#)) and ([1983ANZQ](#), [1987SA15](#); theor.).

**$^{19}\text{N}$**   
(Figs. 5 and 8)

A study of the  $^{48}\text{Ca}(^{18}\text{O}, ^{19}\text{N})^{47}\text{Sc}$  reaction leads to a mass excess of  $15.872 \pm 0.020$  MeV for  $^{19}\text{N}$  ([1983HO08](#)). This and earlier results [see ([1983AJ01](#))] lead to an adopted ([1985WA02](#)) value of  $15.873 \pm 0.019$  MeV.  $^{19}\text{N}$  is then stable with respect to decay into  $^{18}\text{N} + \text{n}$  by 5.32 MeV. The half-life of  $^{19}\text{N}$  is reported to be  $0.32 \pm 0.10$  sec ([1986DU07](#)),  $0.21_{-0.1}^{+0.2}$  sec ([1987MU1J](#)). See also ([1984KL06](#)) and reaction 8 in  $^{19}\text{O}$ .  $P_n \approx 33\%$  ([1987MU1J](#); prelim.). In addition to the ground-state transition ([1982NA08](#)) report the population of states of  $^{19}\text{N}$  at  $E_x = 1.12 \pm 0.04$  and  $1.59 \pm 0.04$  MeV. See also ([1984HI1A](#), [1986HU1A](#), [1986PI09](#)), ([1983DE2E](#), [1983WI1A](#), [1986AN07](#), [1986GU1D](#)) and ([1982CUZZ](#), [1983ANZQ](#), [1983FR1A](#); theor.).

**<sup>19</sup>O**  
(Fig. 5 and 8)

GENERAL: (See also (1983AJ01).)

*Nuclear models:* (1978WI1B, 1983BR29, 1983PO02, 1983SH44, 1984BA24, 1984CH1V, 1984RA13, 1986WA1R).

*Special states:* (1978WI1B, 1983BR29, 1983HU1J, 1983PO02, 1983SH44, 1984BA24, 1984CH1V, 1984RA13, 1984WI17, 1985LE1L, 1986AN07).

*Electromagnetic transitions:* (1983BR29, 1985LE1L).

*Complex reactions involving <sup>19</sup>O:* (1983FR1A, 1983WI1A, 1984GR08, 1984HI1A, 1984HO23, 1985PO11, 1986HA1B, 1986PO06, 1987LI04, 1987RI03).

*Hypernuclei:* (1984AS1D).

*Other topics:* (1978WI1B, 1983BR29, 1983EN04, 1983HU1J, 1984PO11, 1984WI17, 1985AN28, 1985TA26).

*Ground state of <sup>19</sup>O:* (1978WI1B, 1983ANZQ, 1983BU07, 1984FR13, 1985AN28, 1987SA15).

The weighted mean of several half-lives is  $26.91 \pm 0.08$  sec: see (1972AJ02). A recent value is  $27.03 \pm 0.07$  sec (1986AL11). The decay is complex: see <sup>19</sup>F, reaction 30 and Table 19.19. See also (1985XI1A) and (1985BR29; theor.).

See (1983AJ01).

States of <sup>19</sup>O reported in this reaction are displayed in Table 19.3.

Proton groups corresponding to <sup>19</sup>O states with  $E_x < 5.6$  MeV and  $E_\gamma$  measurements are displayed in Table 19.4.

Table 19.1: Energy levels of  $^{19}\text{O}$ <sup>a</sup>

| $E_x$ (MeV $\pm$ keV)         | $J^\pi; T$                               | $\tau$ <sup>b</sup> or $\Gamma_{\text{c.m.}}$ (keV)   | Decay     | Reactions                 |
|-------------------------------|--|---|-----------|---------------------------|
| 0                             | $\frac{5}{2}^+; \frac{3}{2}$             | $\tau_{1/2} = 26.91 \pm 0.08$ sec                     | $\beta^-$ | 1, 2, 3, 4, 5, 7, 8,<br>9 |
| 0.0960 $\pm$ 0.5              | $\frac{3}{2}^+$                          | $\tau_m = 2.00 \pm 0.07$ nsec<br>$g = -0.48 \pm 0.06$ | $\gamma$  | 3, 4, 7, 8, 9             |

<sup>a</sup> For other values and for references see Table 19.5 in ([1978AJ03](#)).

$$5. \begin{array}{ll} (a) ^{18}\text{O}(n, \gamma)^{19}\text{O} & Q_m = 3.957 \\ (b) ^{18}\text{O}(n, n)^{18}\text{O} & E_b = 3.957 \end{array}$$

The thermal capture cross section is  $0.16 \pm 0.01$  mb ([1981MUZQ](#)). The scattering amplitude (bound)  $a = 5.84 \pm 0.07$  fm,  $\sigma_{\text{free}} = 3.86 \pm 0.10$  b ([1979KO26](#)). The total cross section has been measured for  $E_n = 0.14$  to  $2.47$  MeV [see ([1978AJ03](#))] and at  $E_n = 5$  to  $7.5$  MeV [G. Auchampaugh, quoted in ([1986KO10](#))]. A multi-level  $R$ -matrix analysis of this and additional  $\sigma(\theta)$  data leads to the states shown in Table 19.5 and to some additional structures. The five  $\frac{7}{2}^-$  states [ $^{19}\text{O}^*(6.27, 9.64, 9.84, 10.21, 10.66)$ ] (see, however, footnote (a) to Table 19.5) contain about 20 – 30% of the allowed  $f_{7/2}$  single-particle strength. Isobaric analog assignments are presented ([1986KO10](#)). See also ([1982RA1A](#)).

$$6. ^{18}\text{O}(n, \alpha)^{15}\text{C} \quad Q_m = -5.009 \quad E_b = 3.957$$

The total cross sections for the  $\alpha_0$  and  $\alpha_1$  groups have been measured for  $E_n = 7.5$  to  $8.6$  MeV: resonance structure is reported at  $E_n = 7.70 \pm 0.05$  and  $8.05 \pm 0.05$  MeV with  $\Gamma_{\text{lab}} = 0.25$  and  $0.35$  MeV, respectively [ $^{19}\text{O}^*(11.25, 11.58)$ ]: see ([1978AJ03](#)).

$$7. ^{18}\text{O}(d, p)^{19}\text{O} \quad Q_m = 1.732$$

| $5.5035 \pm 3.1$ <sup>f</sup> |  | 9.43                          |
| $5.7046 \pm 4.3$ <sup>g</sup> |  | 9.56                          |
| $6.1196 \pm 3.2$ <sup>h</sup> |  | 9.77                          |
| $6.1916 \pm 5.5$              | $\frac{1}{2}$  | 9.88                          |
| $6.2693 \pm 2.6$              | $\frac{7}{2}$  | 9.93                          |
| $6.4058 \pm 3.1$ <sup>h</sup> |  | 9.98                          |

<sup>a</sup> (1977FO10);  $E(^7\text{Li}) = 16.0$  MeV. Angular distributions have been reported to all states with  $E_x < 6.8$  MeV. See also (1978AJ03).

<sup>b</sup> Derived from total cross section and  $2J + 1$  analysis.

<sup>c</sup> Corresponds to unresolved states. Assuming one of these to be a  $\frac{3}{2}^-$  state (see Table 19.4), the other should have  $J = \frac{7}{2} \rightarrow \frac{13}{2}$ .

<sup>d</sup> May correspond to unresolved states.

<sup>e</sup> If this group corresponds to a single state.

<sup>f</sup> Narrow unresolved states: see discussion in (1977FO10).

<sup>g</sup> Cross section is too large for the known state at this energy with  $J^\pi = \frac{3}{2}^+$ . If this group corresponds to a doublet, the other member should have  $J = \frac{1}{2} \rightarrow \frac{5}{2}$ .

<sup>h</sup> Sharp group; if due to a single state  $J = \frac{11}{2} \rightarrow \frac{17}{2}$ .

<sup>i</sup>  $J = (\frac{7}{2}, \frac{9}{2}, \frac{11}{2})$ .

<sup>j</sup> The total cross section to this state is very high implying unresolved states: if there are two states one must have  $J > \frac{13}{2}$ .

Angular distributions have been measured at  $E_d = 0.8$  to 15 MeV: see (1978AJ03, 1983AJ01). The  $l_n$  values and spectroscopic factors derived from these measurements are displayed in Table 19.4. Branching ratios are shown in Table 19.2.  $^{19}\text{O}^*(0.096)$  has  $g = -0.48 \pm 0.06$ ; its configuration appears to be mainly  $d_{5/2}^3$  and  $B(\text{M1}) = 0.040 \pm 0.015 \mu_N^2$ . The  $\Delta E$  value for the  $1.47 \rightarrow 0.096$  transition is  $1375.3 \pm 0.5$  keV. Assuming  $E_x = 96.0 \pm 0.5$  keV (Table 19.1)  $E_x = 1471.4 \pm 0.7$  keV. Angular correlations are consistent with  $J^\pi = \frac{5}{2}^+$  for ground state and unambiguously fix  $J^\pi = \frac{3}{2}^+$  and  $\frac{1}{2}^+$ , respectively, for  $^{19}\text{O}^*(0.096, 1.47)$ : see (1978AJ03) for references. See also (1986SE1B).

The beta decay of  $^{19}\text{N}$  is reported to involve  $\gamma$ -rays with  $E_\gamma = 96.0 \pm 1.0$ ,  $709.2 \pm 0.8$  and  $3137.8 \pm 1.0$  keV, with relative intensities  $100 \pm 10$ ,  $63 \pm 21$  and  $76 \pm 21$  (1986DU07).

Transitions to  $^{19}\text{O}^*(0[\text{u}], 4.9, 6.3)$  have been observed in the radiative capture of stopped negative pions (1983MA16).

See (1986HEZW;  $E_n = 200$  MeV).

Table 19.4: Levels of  $^{19}\text{O}$  from  $^{17}\text{O}(\text{t}, \text{p})$  and  $^{18}\text{O}(\text{d}, \text{p})$

<sup>a</sup> These data are from a multi-level  $R$ -matrix re-analysis by (1986KO10) of the work displayed in Table 19.4 of (1978AJ03), together with unpublished  $\sigma_t$  data by G.F. Auchampaugh, and  $\sigma(\theta)$  for  $n_0$  and  $n_1$  for  $5.0 < E_n < 7.5$  MeV. Uncertainties in  $E_x$  and  $\Gamma$  cannot be estimated. See also (1986KO10) for other states. I am indebted to Dr. Paul E. Koehler for additional comments.

<sup>b</sup> See Table 19.4 of (1978AJ03):  $\Gamma_{\text{c.m.}}$ .

<sup>c</sup> See discussion in (1986KO10).

<sup>d</sup> May be a doublet, but at least one of the states has  $J^\pi = \frac{7}{2}^-$  (1986KO10).

**$^{19}\text{F}$**   
(Fig. 6 and 8)

GENERAL: (See also (1983AJ01).)

*Shell model:* (1978WI1B, 1979GO13, 1982RA1N, 1983BR29, 1983PO02, 1984MI1H, 1984RA13, 1985BR15, 1986WA1R, 1987KA09).

*Cluster, collective and rotational models:* (1979GO13, 1982RA1N, 1984ME02, 1985DI16, 1985MO20, 1985OH01, 1987DE05, 1987KA09).

*Special states:* (1978WI1B, 1982RA1N, 1983BI1C, 1983BR29, 1983CS01, 1983PO02, 1984AD1E, 1984HO1H, 1984ME02, 1984MI1H, 1984RA13, 1984WI17, 1985AD1A, 1985BR15, 1985DI16, 1985MI10, 1985MO20, 1986AN07, 1986CA27, 1986HA1Q, 1986KA1D, 1986WI1P, 1987DE05).

*Electromagnetic transitions and giant resonances:* (1982BR24, 1983BR29, 1983IS1F, 1983KA28, 1984CA02, 1984MI1H, 1985AD1A, 1985AL21, 1985DI16, 1986CA27, 1986ER1A, 1987DE05).

*Astrophysical questions:* (1981WA1Q, 1982CA1A, 1982NO1D, 1982WI1B, 1982WO1A, 1983AL23, 1983SI1B, 1984CO1H, 1985DW1A).

*Applications:* (1982CO1K, 1982MA1Q, 1983AM1A, 1983BI1M, 1983DE2J, 1983DU1D, 1983TO1F, 1984CA1D, 1985TO1J, 1986KL1B, 1986PI1E, 1987KH1D, 1987KN01).

*Complex reactions involving  $^{19}\text{F}$ :* (1982HO10, 1983DE26, 1983JA05, 1983LE1F, 1983SO08, 1983WI1A, 1984BE22, 1984FI17, 1984GR08, 1984HI1A, 1984HO23, 1984NA12, 1984RA10, 1984SI15, 1985AG1A, 1985BE40, 1985GR1J, 1985HO05, 1985MC03, 1985MO08, 1985OS05, 1985PO11, 1985WA22, 1986AI1A, 1986FE03, 1986GR1A, 1986GR1B, 1986HA1B, 1986PL02, 1986PO06, 1986SA30, 1986SC28, 1986SC29, 1986SH2B, 1986SH1F, 1986SO10, 1986VA23, 1986WE1C, 1987KO15, 1987PA01, 1987RI03).

*Muon and neutrino capture and reactions:* (1984GR03, 1987SU06).

*Pion capture and reactions:* (1982BI08, 1982LI15, 1983GE12, 1983GM1A, 1983MA16, 1985BI01, 1986NA1K, 1986RO03, 1987KA09).

*Anti-nucleon interactions:* (1984GI11, 1986RO23, 1986SP01, 1987PO05).

*Hypernuclei:* (1984AS1D).

*Other topics:* (1978WI1B, 1981CL05, 1982HA43, 1983AD1B, 1983AR1J, 1983BI1C, 1983BR29, 1983SH32, 1984HO1H, 1984MI1H, 1984WI17, 1985AD1A, 1985AL21, 1985AN28, 1985MI10, 1986LA29, 1986NA1K).

*Ground state of  $^{19}\text{F}$ :* (1978WI1B, 1982HA43, 1982LO13, 1983ANZQ, 1983AR1J, 1983BR27, 1983BU07, 1983RO1E, 1984AN1B, 1984AR1D, 1984WE04, 1985AN28, 1985HA18, 1985NA1A, 1986CA27, 1986RO03, 1987BR1F).

Table 19.6: Energy levels of  $^{19}\text{F}$  <sup>a</sup>

| $E_x$ (MeV $\pm$ keV) | $J^\pi; T$                   | $K^\pi$         | $\tau_m$ or $\Gamma_{\text{c.m.}}$ (keV)        | Decay    | Reactions  |

<sup>a</sup> See also Tables 19.7 and 19.8.

<sup>b</sup> For evidence of additional states see reaction 32.

<sup>c</sup> See Table 19.11.

$$\langle r^2 \rangle^{1/2} = 2.885 (15) \text{ fm} \text{ [see (1978AJ03)]}$$

$$\mu_{\text{g.s.}} = +2.628866 (8) \text{ nm (1978LEZA)}$$

$$\mu_{0.197} = +3.607 (8) \text{ nm (1978LEZA)}$$

$$Q_{0.197} = -0.12 \pm 0.02 \text{ b (1978LEZA).}$$

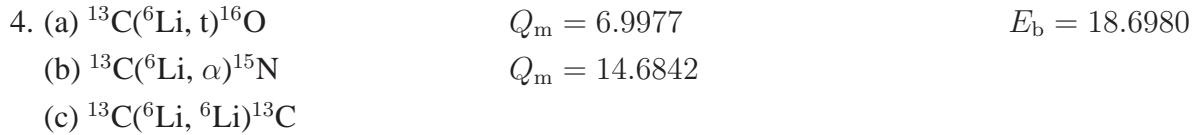

Vector analyzing power measurements for the elastic scattering have been reported at  $E(^7\vec{\text{Li}}) = 21.1 \text{ MeV}$  ([1984MO06](#)). Fusion cross sections have been measured by ([1982DE30](#)). For other channels in the interaction of  $^{12}\text{C} + ^7\text{Li}$  see ([1978AJ03](#), [1983AJ01](#)). See also ([1986KA1C](#), [1986MO1E](#)) and ([1985SA13](#), [1986YO1A](#); theor.).

For excitation curves and angular distributions involving unresolved states and  $^{19}\text{F}^*(2.78)$  see ([1983AJ01](#)) and ([1982HU06](#), [1983JA09](#)). See also ([1986BE19](#); theor.).

States in  $^{19}\text{F}$  with  $5.4 < E_x < 11.0 \text{ MeV}$  observed in reaction (a) are displayed in Table [19.9](#). For reaction (b) see ([1982SA27](#)). See also ([1983AJ01](#)).

Uncorrelated structures have been observed in the excitation functions for reactions (a) and (b). Fusion cross sections have also been measured: see ([1983AJ01](#)). See also ([1981GL02](#)) for reaction (a),  $^{13}\text{C}$  and  $^{15}\text{N}$  in ([1986AJ01](#)) and  $^{16}\text{O}$  in ([1986AJ04](#)).

See ([1983AJ01](#)).

<sup>a</sup>  $|M|^2 = 21.4 \pm 0.3$  W.u. (1983BI03) for the E2 transition [1.35  $\rightarrow$  0.11]. See also (1985KE1C) and Table 19.8 in (1983AJ01).

<sup>b</sup>  $|M|^2 = 3.1 \pm 0.3$  W.u. (1983BI03). See also (1983AJ01).

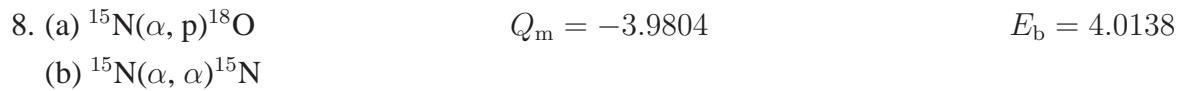

c See Table 19.8 in (1983AJ01) and Table 19.9 here.

See (1986NE1A) for reaction (a), (1986GO1B) for (b) and (1982DE39) for reaction (c).

Resonances in yield of  $\gamma$ -rays are observed below  $E_\alpha = 10.4$  MeV: the parameters for these are displayed in Table 19.10. Branching ratios are shown in Table 19.7 and  $\tau_m$  measurements in Table 19.8. The  $J^\pi$  values shown in Table 19.10 are based on correlation and angular distribution measurements and on branching ratio determinations. See also (1985DI16).

The  $E_x$  of states involved in cascade decays are  $3999.6 \pm 1.2$ ,  $4031.9 \pm 0.4$ ,  $4377 \pm 1$  and  $4548 \pm 2$  keV. The  $K^\pi = \frac{1}{2}^-$  band involves  $^{19}\text{F}^*(0.110[\frac{1}{2}^-], 1.46[\frac{3}{2}^-], 1.35[\frac{5}{2}^-], 4.00[\frac{7}{2}^-], 4.03[\frac{9}{2}^-], 7.16[\frac{11}{2}^-])$  and possibly  $^{19}\text{F}^*(8.29)[\frac{13}{2}^-]$  [ $J^\pi$  in brackets]. See, however, reaction 9. See (1972AJ02) for a discussion of the evidence for other assignments of  $J^\pi$  and  $K^\pi$ .  $^{19}\text{F}^*(10.41)$  is likely to be the second  $\frac{13}{2}^+$  ( $2s, 1d$ )<sup>3</sup> state in  $^{19}\text{F}$ . For references see (1983AJ01).

Resonances observed in the  $(\alpha, \alpha'\gamma)$  and  $(\alpha, \text{p}\gamma)$  reactions and in the elastic scattering are displayed in Table 19.11. See also (1985OH04; theor.).

At  $E(^6\text{Li}) = 22$  MeV angular distributions are reported to  $^{19}\text{F}^*(0.11, 1.35[\text{u}], 1.46, 4.0[\text{u}], 8.29[\text{u}], 8.96[\text{u}])$ . Comparisons are made with the results from the  $^{16}\text{O}(^6\text{Li}, \text{d})^{20}\text{Ne}$  reaction, in an attempt to determine whether  $^{19}\text{F}^*(8.95)$  is the  $\frac{11}{2}^-$  member of the  $K^\pi = \frac{1}{2}^-$  band, of which  $^{19}\text{F}^*(8.29)$  is the  $\frac{13}{2}^-$  member (1984MO08, 1985MO20) [but see (1985DI16)]. Configuration mixing in the  $\frac{11}{2}^-$  states [ $^{19}\text{F}^*(7.17, 8.95, 9.87)$ ] and in the  $\frac{7}{2}^-$  states [ $^{19}\text{F}^*(4.00, 5.42)$ ] to which they decay appears to be involved (1987FO03).

This reaction has been studied at  $E(^7\text{Li}) = 40$  MeV: see Table 19.11 in (1983AJ01).

<sup>a</sup> (1986VEZT) and W.J. Vermeer, private communication;  $E(^{11}\text{B}) = 33, 35, 38$  and  $48$  MeV.

<sup>b</sup> Derived.

See (1983AJ01).

At  $E(^{13}\text{C}) = 105$  MeV groups are reported to states which are generally unresolved;  $J^\pi$  assignments are suggested: see (1983AJ01).

For reaction (a) see (1978AJ03). The excitation function for reaction (b) has been measured for  $E_t = 0.3$  to  $3.7$  MeV: there is evidence for a maximum at  $E_t = 2.5$  MeV. For resonances in the yields of  $p_0, p_1, \alpha_0, \alpha_{1+2}$  see (1978AJ03). The elastic yield [reaction (d)] shows a large number of resonances: their parameters are displayed in Table 19.12. See also (1982AO06, 1983AO03; theor.).

<sup>a</sup> For references see Tables 19.8 in ([1978AJ03](#)) and 19.9 in ([1983AJ01](#)). For branching ratios see Table [19.7](#) here.  $\omega\gamma \equiv (\Gamma_\alpha \Gamma_\gamma / \Gamma) \frac{1}{2}(2J + 1)$ . Preliminary results by ([1987MAZV](#)) for  $^{19}\text{F}^*(4.550, 4.556 [J^\pi = \frac{5}{2}^+, \frac{3}{2}^-])$  are  $\omega\gamma = (9.7 \pm 2.0) \times 10^{-5}$  eV [ $\Gamma_\alpha = (3.2 \pm 0.7) \times 10^{-5}$  eV] and  $\omega\gamma < 1 \times 10^{-5}$  eV [ $\Gamma_\alpha < 5 \times 10^{-6}$  eV], respectively.

<sup>b</sup>  $\Gamma_\alpha = 2.1 \pm 0.7$  meV,  $\Gamma_\gamma = 40.7 \pm 8.1$  meV.

<sup>c</sup> See also Table 19.7 in ([1972AJ02](#)).

<sup>d</sup>  $\omega\gamma (55^\circ)$  for this value and all values below.

<sup>e</sup> Value recalculated by reviewer from  $E_x$ .

<sup>f</sup>  $\Gamma_\alpha/\Gamma_p = 0.026 \pm 0.008$ .

<sup>g</sup>  $\Gamma_\alpha/\Gamma_p = 0.1 \pm 0.04$ . Using  $\Gamma = 0.57 \pm 0.03$  keV (Table [19.18](#)),  $\Gamma_\alpha = 0.052 \pm 0.03$ ,  $\Gamma_p = 0.52 \pm 0.03$  keV.

<sup>h</sup>  $\Gamma_\alpha/\Gamma_p = 0.55 \pm 0.16$ .

<sup>i</sup> See ([1982KR05](#)).

<sup>j</sup> See also ([1985DI16](#)).

Angular distributions have been measured at  $E_\alpha = 20.1$  to  $40$  MeV: see ([1978AJ03](#), [1983AJ01](#)). States observed in this reaction are displayed in Table 19.2 of ([1978AJ03](#)). See also ([1986LE1Q](#); theor.).

This reaction (and its mirror reaction  $^{16}\text{O}(^{6}\text{Li}, t)^{19}\text{Ne}$  [see  $^{19}\text{Ne}$ ]) have been studied at  $E(^6\text{Li}) = 24$  and  $46$  MeV: see ([1978AJ03](#), [1983AJ01](#)). Members of the  $K^\pi = \frac{1}{2}^+$  and  $\frac{1}{2}^-$  rotational bands have been identified: see Table [19.13](#). Other groups, mainly to unresolved states, have also been observed.

Many states have been populated in this reaction: see Table 19.14 in ([1978AJ03](#)) and ([1984MO28](#);  $E(^7\text{Li}) = 20$  MeV). Angular distributions in the latter work have been analyzed via Hauser-Feshbach compound nucleus calculations and FRDWBA, The  $K^\pi = \frac{1}{2}^+$  and  $\frac{1}{2}^-$  states [see Table [19.13](#)] are discussed ([1984MO28](#)).

<sup>a</sup> For references see Tables 19.9 in (1978AJ03) and 19.10 in (1983AJ01). See also footnote (c).

<sup>b</sup> Resonances below  $E_\alpha = 5.5$  MeV are observed in  $(\alpha, \alpha_0)$ ; resonances above that energy are observed in  $(\alpha, \text{p}\gamma)$  and  $(\alpha, \alpha'\gamma)$ , except those labelled (c).

<sup>c</sup>  $^{15}\text{N}(\alpha, \alpha_0)$ : S.K.B. Hesmondhalgh, private communication. The total width shown is in the c.m. system and assumes  $\Gamma_{\text{tot}} = \Gamma_{\alpha_0}$ . I am indebted to Dr. Serena Hesmondhalgh for permission to quote this work and for a number of other useful comments.

<sup>d</sup> Value recalculated by reviewer from  $E_x$ .

<sup>e</sup> See, however, reaction 29.

See reaction 6 in  $^{19}\text{Ne}$ . See also (1983AJ01).

<sup>a</sup> (1980WI17). See also Tables 19.7 and 19.15.

<sup>b</sup>  $J^\pi = \frac{5}{2}^-$ .

<sup>c</sup>  $J^\pi = \frac{9}{2}^-$ .

<sup>d</sup>  $J^\pi = \frac{1}{2}^-, \frac{3}{2}^-$ .

<sup>e</sup>  $J^\pi = \frac{1}{2}^+$ .

At  $E_\alpha = 47.5$  MeV angular distributions have been studied to the  $\frac{1}{2}^+ \rightarrow \frac{9}{2}^+$  and the  $\frac{13}{2}^+$  members of the  $K = \frac{1}{2}^+$  band [ $^{19}\text{F}^*(0, 0.197, 1.55, 2.78, 4.65, 5.47)$ ], to two  $\frac{11}{2}^+$  states  $^{19}\text{F}^*(6.49, 7.94)$  [both of which are strongly populated] and to the  $\frac{7}{2}^+$  state at 4.38 MeV. The reaction populates strongly only those positive-parity states that are predominantly (sd)<sup>3</sup>: see (1983AJ01).

This reaction has recently been studied for  $E_p = 80$  to 2200 keV by (1980WI17). A large number of resonances have been investigated and  $E_{\text{res}}$ , total and partial widths, branching and mixing ratios and  $\omega\gamma$  values are reported. Transition strength arguments as well as analyses of  $\gamma$ -ray angular distribution data lead to  $J^\pi$  assignments: see Tables 19.7, 19.14 and 19.15 for a display of the results (1980WI17).

In addition absolute cross sections measured for direct capture lead to  $C^2S$  values for a number of states of  $^{19}\text{F}$ . Reduced widths and  $J^\pi$  determinations lead (1980WI17) to postulate  $^{19}\text{F}^*(3.91, 4.55, 4.38, 6.59, 6.50, 10.43)$  as the  $J^\pi = \frac{3}{2}^+, \frac{5}{2}^+, \frac{7}{2}^+, \frac{9}{2}^+, \frac{11}{2}^+, \frac{13}{2}^+$  states of  $K^\pi = \frac{3}{2}^+$  rotational

| $> 2300$ <sup>d</sup>         |                             |   |                           |                     |

<sup>a</sup> For references see Tables 19.15 in (1978AJ03) and 19.16 in (1983AJ01). See also Tables 19.7 and 19.14.

<sup>b</sup> Supported by direct capture into this state with a  $\sin^2 \theta$  distribution of the d.c.  $\gamma$ -rays and by interference patterns near the resonance.

<sup>c</sup> Decays partly (see Table 19.7) via a state at  $8015 \pm 2$  keV with  $J^\pi = \frac{5}{2}^+$ .

<sup>d</sup> See Table 19.15 in (1978AJ03).

<sup>e</sup>  $\Gamma_p = 0.17$  eV,  $\Gamma_\alpha = 220$  eV,  $\Gamma_\gamma = 1.3$  eV.

<sup>f</sup>  $\Gamma_\gamma = 0.71 \pm 0.17$  eV,  $\Gamma_p = 0.019 \pm 0.009$  eV,  $\Gamma_\alpha = 46 \pm 19$  eV,  $\Gamma_{\text{total}} = 47 \pm 19$  eV.

<sup>g</sup>  $\Gamma_\gamma = 0.85 \pm 0.17$  eV,  $\Gamma_p = 224 \pm 43$  eV,  $\Gamma_\alpha = 3410 \pm 1220$  eV.

<sup>h</sup> The strength of the transition to  $^{19}\text{F}^*(7.262)$  [see Table 19.7] limits  $J$  to  $\frac{1}{2}$  or  $\frac{3}{2}$  for that state.

<sup>i</sup> The angular distribution of the  $\gamma$ -ray from this state to  $^{19}\text{F}^*(5.62)$  and branching ratio arguments lead to  $J = \frac{5}{2}$  for that state.

<sup>j</sup> (1982BE29).

band;  $^{19}\text{F}^*(7.70 \text{ or } 7.26, 6.09, 9.82, 6.93, 9.87)$  as the  $J^\pi = \frac{1}{2}^-, \frac{3}{2}^-, \frac{5}{2}^-, \frac{7}{2}^-$  and  $\frac{11}{2}^-$  members of the excited  $K^\pi = \frac{1}{2}^-$  rotational band; and  $^{19}\text{F}^*(4.56, 4.68, 5.42, 6.10, 7.17)$  as the  $J^\pi = \frac{3}{2}^-, \frac{5}{2}^-, \frac{7}{2}^-, \frac{9}{2}^-$  and  $\frac{11}{2}^-$  members of the  $K^\pi = \frac{3}{2}^-$  rotational band. The direct capture transition to  $^{19}\text{F}^*(7.54)$  indicates some isospin mixing in this  $\frac{5}{2}^+$ , first  $T = \frac{3}{2}$  state in  $^{19}\text{F}$  ([1980WI17](#)). See also Table 19.6.

<sup>a</sup> See Table 19.16 in (1978AJ03) for the references.

<sup>b</sup> n means total yield.

<sup>c</sup> Errors here and below are estimated from published data of (1964BA16) by H.B. Willard, private communication.

<sup>d</sup> See also (1982DI11).

Stellar reaction rates have also been calculated: the data cover  $T_9 = 0.01 - 5.0$ . The consequences for the final termination of the CNO tri-cycle are discussed by (1980WI17). See also (1982KR05), (1982RO1A, 1982WI1B; astrophysics) and (1982MA1Q, 1983AM1D; applications).

<sup>a</sup> See also Tables 19.14 in ([1972AJ02](#)) and 19.17 in ([1978AJ03](#)) for the earlier work and references.

<sup>b</sup> See also Table [19.15](#).

<sup>c</sup>  $\omega\gamma = 420 \pm 80$  eV ([1979LO01](#)).

<sup>d</sup> Widths not in accord with  $\Gamma$  measured by ([1979LO01](#)) who calculate also  $\omega\gamma \approx 1.2 \times 10^5$  eV.

<sup>e</sup> See ([1982DI11](#)). A resonance at  $E_p = 4.58$  MeV in the p channel is also reported. It is suggested that the states corresponding to  $E_x = 12.33, 12.52$  and  $13.32$  MeV have  $T = \frac{3}{2}$  and  $J^\pi = (\frac{3}{2}^+), \frac{5}{2}^{(+)}$  and  $\frac{3}{2}^-$ , respectively.

<sup>f</sup> The parameters of this resonance and most of the ones below are from a phase-shift analysis by ([1979MU05](#)) of the elastic scattering for  $E_p = 6.1$  to  $16.6$  MeV. Other structures have also been observed but parameters for those have not been obtained.

<sup>g</sup> See also ([1986CO1F](#); prelim.).

Yield measurements are reported from  $E_{\text{p}} = 2.5$  to  $13.5$  MeV [see (1978AJ03) for the references]. The observed resonances are displayed in Table 19.16.

Scattering studies have been carried out for  $E_{\text{p}} = 0.6$  to  $16.3$  MeV and for  $E_{\vec{\text{p}}} = 6.1$  to  $16.6$  MeV: see (1978AJ03, 1983AJ01). Pronounced resonant structure is evident up to  $14$  MeV. Observed resonances are shown in Table 19.17. For polarization measurements see (1982GL08;  $E_{\vec{\text{p}}} = 800$  MeV). See also (1982NA13, 1984PH02, 1986DE1G; theor.).

For polarization measurements at  $E_{\vec{\text{p}}} = 90$  MeV see (1985VOZZ; prelim.). See also (1978AJ03).

Yield measurements have been studied for  $E_{\text{p}} = 72$  keV to  $14$  MeV: see (1972AJ02, 1983AJ01); observed resonances are displayed in Table 19.17. See also (1982RO1A, 1982WI1B, 1984HA1R, 1984HA1Z, 1986BA89, 1987RO25; astrophys.) and (1982MA1Q, 1986CO2B; applied).

Angular distributions of neutron groups corresponding to  $^{19}\text{F}$  states with  $E_{\text{x}} < 8.2$  MeV have been measured at  $E_{\text{d}} = 3$  and  $4$  MeV: see Table 19.18 in (1978AJ03) and Table 19.18 here.

Angular distributions of the deuterons corresponding to many states of  $^{19}\text{F}$  have been analyzed by DWBA: the results are shown in Table 19.18. The spectroscopic factors obtained for  $^{19}\text{F}^*(7.54, 8.80)$ , the  $T = \frac{3}{2}$ ,  $J^\pi = \frac{5}{2}^+$  and  $\frac{1}{2}^+$  analogs of  $^{19}\text{O}^*(0, 1.47)$  are in good agreement with those obtained for the  $^{19}\text{O}$  states in the  $^{18}\text{O}(\text{d}, \text{p})^{19}\text{O}$  reaction: see (1978AJ03). A search for a state at  $E_{\text{x}} = 7.90$  MeV [just below the  $^{18}\text{O} + \text{p}$  threshold, and of astrophysical interest] has been unsuccessful:  $\theta_{\text{p}}^2 < 5 \times 10^{-5}$  (1986CH29). See also (1983MU13, 1984BL21; theor.).

Table 19.18: Energy levels of  $^{19}\text{F}$  from  $^{18}\text{O}(\text{d}, \text{n})^{19}\text{F}$  and  $^{18}\text{O}(^3\text{He}, \text{d})^{19}\text{F}$ <sup>a</sup>

| 9.682 $\pm$ 15                     |                  |                                |                                  |
| 10.275 $\pm$ 15                    |                  |                                |                                  |
| 10.33 $\pm$ 15                     |                  |                                |                                  |
| 10.525 $\pm$ 15                    |                  |                                |                                  |

<sup>a</sup> See also Table 19.18 in (1978AJ03). Column 3 should refer to footnote (c).

<sup>b</sup>  $^{18}\text{O}(^3\text{He}, \text{d})$ :  $E(^3\text{He}) = 16$  MeV, except where footnote is shown.

<sup>c</sup>  $^{18}\text{O}(\text{d}, \text{n}\gamma)$ .

<sup>d</sup> Many of the states with  $E_x \geq 4.5$  MeV are unresolved: compare with Table 19.6.

<sup>e</sup>  $^{18}\text{O}(^3\text{He}, \text{d})$ :  $E(^3\text{He}) = 26.4$  MeV (1986CH29) (and A.E. Champagne, private communication).  $\theta_p^2 = 1.3 \times 10^{-2}$  and  $7.4 \pm 10^{-4}$ , respectively for  $^{19}\text{F}^*(8.01, 8.31)$ .

The decay is primarily by allowed transitions to  $^{19}\text{F}^*(0.197, 1.55)$ ,  $J^\pi = \frac{5}{2}^+, \frac{3}{2}^+$ . Very weak branches are also observed to  $^{19}\text{F}^*(0.11, 1.35, 3.91, 4.39)$ ,  $J^\pi = \frac{1}{2}^-, \frac{5}{2}^-, \frac{3}{2}^+, \frac{7}{2}^+$ : see Table 19.19. The half-life is  $26.91 \pm 0.08$  sec: see reaction 1 in  $^{19}\text{O}$ . The character of the allowed decay to the  $\frac{5}{2}^+$  and  $\frac{3}{2}^+$  states, and the forbiddenness of the decay to the ground state of  $^{19}\text{F}$  are consistent with  $J^\pi = \frac{5}{2}^+$  for the ground state of  $^{19}\text{O}$ , and then with ( $\frac{7}{2}^+$ ) for  $^{19}\text{F}^*(4.39)$ . Gamma-ray branching ratios are displayed in Table 19.7. See also (1983AJ01, 1985BR29).

31.  $^{19}\text{F}(\gamma, \text{n})^{18}\text{F}$

$Q_m = -10.4320$

The cross section for  $(\gamma, \text{Tn})$  has been measured for  $E_\gamma = 10.5$  to 28 MeV: it shows a clear resonance at  $E_\gamma \approx 12$  MeV and unresolved structures at higher energies: see (1978AJ03). See also (1982COZV), (1972AJ02), (1982VI07; applications) and (1983KA28; theor.).

<sup>a</sup> (1982OL02). See Table 19.19 in (1978AJ03) for the earlier work.

<sup>b</sup>  $E_x$  shown with uncertainties were determined by (1982OL02).

32. (a)  $^{19}\text{F}(\gamma, \text{p})^{18}\text{O}$        $Q_m = -7.9942$   
 (b)  $^{19}\text{F}(\gamma, \text{t})^{16}\text{O}$        $Q_m = -11.7003$

(1984KE04) have measured absolute differential cross sections for the  $p_0$  and  $p_1$  channels at 7 angles for  $E_\gamma = 13.4$  to 25.8 MeV. Angle integrated cross sections for  $(\gamma, p_0)$  show pronounced structures at  $E_\gamma = 15.45, 16.70, 17.35$  and 18.55 MeV as well as a broad bump at  $\approx 20.5$  MeV. Additional minor structures may exist at  $E_\gamma = 13.65, 14.35, 15.85, 17.90, 19.5, 21.3, 22.2$  and 23.5 MeV. In the  $(\gamma, p_1)$  reaction broad bumps appear at  $\approx (17.0)$  and 21.5 MeV. The E2 cross section [from  $(\gamma, p_0)$  angular distribution coefficients] is estimated to be  $\approx 0.37$  of the E2 EWSR (1984KE04). The  $(\gamma, p_{\text{tot}})$  cross section to 26 MeV has been derived by (1985KE03). See also (1978AJ03).

In reaction (b) the  $(\gamma, t_0)$  reaction has been studied for  $E_\gamma = 18$  to 23 MeV: two peaks are observed at  $E_\gamma = 18.8$  and 20.1 MeV. It is suggested that  $J^\pi = \frac{1}{2}^-$  or  $\frac{3}{2}^-$ ,  $T = \frac{1}{2}$ . The  $(\gamma, t_0)$  process contributes  $\approx 1\%$  to the total GDR: see (1978AJ03).

33.  $^{19}\text{F}(\gamma, \gamma)^{19}\text{F}$

The energy of the first excited state is  $109.894 \pm 0.005$  keV; its width is  $(5.1 \pm 0.7) \times 10^{-7}$  eV.  $^{19}\text{F}^*(1.46, 3.91, 7.66)$  are also excited. The scattering cross section is relatively small and structureless for  $E_\gamma = 14$  to 30 MeV: see ([1978AJ03](#)).

34.  $^{19}\text{F}(\text{e}, \text{e})^{19}\text{F}$

With  $E_\text{e} = 78$  to 340 MeV, and with an energy resolution of 25–50 keV, most states of  $^{19}\text{F}$  with  $E_\text{x} < 7.7$  MeV have been observed and the longitudinal and transverse form factors have been derived and compared with shell-model calculations. The spectrum of positive-parity longitudinal excitations is dominated at higher momentum transfer by the  $\frac{1}{2}^+ \rightarrow \frac{9}{2}^+$  members of the ground state  $K^\pi = \frac{1}{2}^+$  band. The C2 strength is concentrated at  $E_\text{x} < 1.5$  MeV with a small secondary concentration for  $5.5 < E_\text{x} < 6.5$  MeV. The C4 strength is spread from 3 to 6 MeV, dominantly in  $^{19}\text{F}^*(2.78)$  [ $J^\pi = \frac{9}{2}^+$ ]. The spectra of longitudinal excitations of negative parity states are dominated by  $^{19}\text{F}^*(1.35)$  [ $J^\pi = \frac{5}{2}^-$ ] and  $^{19}\text{F}^*(5.5)$  [ $\frac{5}{2}^- + \frac{7}{2}^-$ ]. In the transverse mode  $^{19}\text{F}^*(0.11, 6.79)$  [ $J^\pi = \frac{1}{2}^-, \frac{3}{2}^-$ , respectively] are prominent. Agreement with theory is good for  $\frac{5}{2}^-$  and  $\frac{7}{2}^-$  but poorer for  $\frac{1}{2}^-$  and  $\frac{3}{2}^-$  states. The parity of  $^{19}\text{F}^*(5.34)$  is uncertain while that of  $^{19}\text{F}^*(6.55)$  is probably positive. States are reported at 7.587 and 7.753 MeV with  $J^\pi = (\frac{5}{2}^-)$  and  $(\frac{7}{2}^-)$ , respectively ([1985BR15](#)). The form factors for  $^{19}\text{F}^*(0, 0.11, 2.78)$  have also been studied by ([1986DO10](#)) for  $q = 0.4 - 2.8$  fm $^{-1}$ . For electromagnetic transition rates see Table 19.20. For the earlier work see ([1978AJ03](#), [1983AJ01](#)). See also ([1985TU1B](#), [1987DE43](#)) and ([1983BR27](#), [1986BO29](#), [1986BR1X](#); theor.).

35.  $^{19}\text{F}(\text{n}, \text{n})^{19}\text{F}$

Angular distributions of neutron groups have been reported at  $E_\text{n} = 2.6, 14.1$  and 14.2 MeV: see ([1972AJ02](#)).

36.  $^{19}\text{F}(\text{p}, \text{p})^{19}\text{F}$

Table 19.21 in ([1978AJ03](#)) displays energy levels of  $^{19}\text{F}$  derived from this reaction. Angular distributions of various proton groups have been measured from  $E_\text{p} = 4.3$  to 35.2 MeV [see ([1978AJ03](#), [1983AJ01](#))] and at  $E_\text{p} = 2.76$  and 2.97 MeV ([1986OU01](#)). The ground-state rotational band is characterized by  $\beta_2 = 0.44 \pm 0.04$ ,  $\beta_4 = 0.14 \pm 0.04$ . The  $g$  of  $^{19}\text{F}^*(0.197)$  is  $1.442 \pm 0.003$  ([1969BL18](#)),  $1.438 \pm 0.005$  ([1984AS03](#)). The mixing ratio for the  $1.46 \rightarrow 0.11$  transition  $(\frac{3}{2}^- \rightarrow$

Table 19.20: Electromagnetic transition rates from  $^{19}\text{F}(\text{e}, \text{e})$ <sup>a</sup>

| $E_x$ in $^{19}\text{F}$ (MeV) | $J^\pi$                          | Mult. | $ M ^2$ <sup>b</sup>           |
|--------------------------------|----------------------------------|-------|--------------------------------|

| 7.66                           | $\frac{3}{2}^+; T = \frac{3}{2}$ | M1    | $0.26 \pm 0.08$                |

<sup>a</sup> (1985BR15). See Table 19.20 in (1978AJ03) for the earlier work. P.M. Endt (private communication) adopts  $|M|^2 = 8.9 \pm 0.5$  (C3),  $6.9 \pm 0.5$  (C2) and  $6.1 \pm 2.4$  W.u. (M5) for the ground state transitions of  $^{19}\text{F}^*(1.35, 1.55, 2.78)$ .

<sup>b</sup>  $B(\text{C1})$  in units of  $e^2 \cdot \text{fm}^2$ ,  $B(\text{M1})$  in units of  $\mu_N^2$ ,  $B(\text{C2})$  in units of  $e^2 \cdot \text{fm}^4$  and  $B(\text{M2})$  in units of  $\mu_N^2 \cdot \text{fm}^2$ . These are for transitions *from* the ground state.

$\frac{1}{2}^-$ ;  $K = \frac{1}{2}^-$  band)  $\delta(\text{E2/M1}) = 0.248 \pm 0.020$ . The E2 strength is  $18.7 \pm 1.9$  W.u. The  $1.46 \rightarrow 0$  transition is pure E1 ( $\delta = 0.01 \pm 0.03$ ). For references see (1983AJ01). See also  $^{20}\text{Ne}$ , (1985OU01, 1986HA1T) and (1983IK1B).

### 37. $^{19}\text{F}(\text{d}, \text{d})^{19}\text{F}$

Angular distributions have been measured for  $E_{\text{d}} = 2.0$  to  $15$  MeV: see (1972AJ02, 1978AJ03).

### 38. $^{19}\text{F}(\text{t}, \text{t})^{19}\text{F}$

Elastic angular distributions have been studied for  $E_t = 2$  and 7.2 MeV: see ([1972AJ02](#)).

39.  $^{19}\text{F}(^3\text{He}, ^3\text{He})^{19}\text{F}$

Elastic angular distributions have been measured for  $E(^3\text{He}) = 4.0$  to 29 MeV [see ([1972AJ02](#), [1978AJ03](#))] and at 25 MeV ([1982VE13](#)).  $\langle r^2 \rangle_{\text{matter}}^{1/2} = 2.72 \pm 0.12$  fm ([1982VE13](#)).

40.  $^{19}\text{F}(\alpha, \alpha)^{19}\text{F}$

Elastic angular distributions have been studied at  $E_\alpha = 19.9$  to 23.3 MeV and at 38 MeV: see ([1972AJ02](#)). Many inelastic groups have also been studied: see Table 19.22 in ([1978AJ03](#)).

The energy of the  $\gamma$ -ray from the  $1.35 \rightarrow 0.11$  transition is  $1235.8 \pm 0.2$  keV;  $E_x$  is then  $1345.7 \pm 0.2$  keV.  $|g| = 0.269 \pm 0.043$  ([1983BI03](#)). See also Table 19.7. For  $\tau_m$  see Table 19.8.  $^{19}\text{F}^*(4.65)$  decays to the  $\frac{9}{2}^+$  state  $^{19}\text{F}^*(2.78)$ : the angular distribution of the cascade  $\gamma$ -rays and the  $\tau_m$  of  $^{19}\text{F}^*(4.65)$  set  $J^\pi = \frac{13}{2}^+$ . See also ([1980ZO04](#), [1984CS01](#), [1984SA28](#), [1986NO1F](#)) and ([1983AJ01](#)).

41. (a)  $^{19}\text{F}(^6\text{Li}, ^6\text{Li})^{19}\text{F}$

(b)  $^{19}\text{F}(^7\text{Li}, ^7\text{Li})^{19}\text{F}$

See ([1978AJ03](#)).

42. (a)  $^{19}\text{F}(^{12}\text{C}, ^{12}\text{C})^{19}\text{F}$

$$(b) ^{19}\text{F}(^{12}\text{C}, ^{12}\text{C})^{19}\text{F}^* \rightarrow \alpha + ^{15}\text{N} \quad Q_m = -4.0138$$

Angular distributions (reaction (a)) have been studied at  $E(^{12}\text{C}) = 40.6$  MeV [see ([1983AJ01](#))] and at 30.0 to 60.1 MeV [as well as at  $E(^{19}\text{F}) = 63.8$  MeV] ([1984TA08](#), [1986TAZO](#); to  $^{19}\text{F}^*(0, 0.197, 1.55, 2.78)$ ) and at  $E(^{19}\text{F}) = 46.5$  to 57.1 MeV ([1984MA32](#); to  $^{19}\text{F}^*(0, 0.197)$ ) [see it and ([1986VO12](#)) for yield measurements].

Angular correlations involving the  $\alpha$ -decay to  $^{15}\text{N}_{\text{g.s.}}$  of twenty  $^{19}\text{F}$  states have been measured at  $E(^{19}\text{F}) = 78.5, 82$  and 144 MeV and analyzed with DWBA and strong absorption model calculations. Two new states with  $J^\pi = \frac{5}{2}^-$  or  $\frac{7}{2}^-$  are reported at 7.740 and 8.277 MeV [estimated  $\pm 0.04$  MeV]. It is suggested that  $^{19}\text{F}^*(7.26, 9.287)$  are  $\frac{3}{2}^+$  and  $\frac{7}{2}^+, \frac{9}{2}^+$ , respectively ([1985SM04](#)). See also ([1986GA13](#), [1986IKZZ](#), [1986MA1Z](#)), ([1983AJ01](#), [1983BI13](#), [1984FR1A](#), [1984HA53](#), [1985HU04](#)) and ([1982GI1C](#), [1982LO13](#), [1983CI08](#), [1986HA13](#), [1986HE1A](#), [1987CO01](#); theor.).

43. (a)  $^{19}\text{F}(^{14}\text{N}, ^{14}\text{N})^{19}\text{F}$   
 (b)  $^{19}\text{F}(^{15}\text{N}, ^{15}\text{N})^{19}\text{F}$

Elastic scattering angular distributions have been studied at  $E(^{14}\text{N}) = 19.5$  MeV and at  $E(^{15}\text{N}) = 23, 26$  and  $29$  MeV: see ([1983AJ01](#)).

44. (a)  $^{19}\text{F}(^{16}\text{O}, ^{16}\text{O})^{19}\text{F}$   
 (b)  $^{19}\text{F}(^{18}\text{O}, ^{18}\text{O})^{19}\text{F}$

Elastic angular distributions have been studied at  $E(^{16}\text{O}) = 21.4$  and  $25.8$  MeV and at  $E(^{19}\text{F}) = 27, 30, 33$  and  $36$  MeV (reaction (a)) [also to  $^{19}\text{F}^*(1.46)$  at the two higher energies], and  $E(^{16}\text{O}) = 60$  and  $80$  MeV ([1986FUZV](#); also to  $^{19}\text{F}^*(0.20, 1.55, 2.78)$ ), and at  $27, 30$  and  $33$  MeV [reaction (b)]: see ([1978AJ03](#)). See also ([1986FU1C](#), [1986GA13](#)), ([1983DU13](#), [1986BA69](#)) and ([1982OH05](#); theor.).

45.  $^{19}\text{F}(^{23}\text{Na}, ^{23}\text{Na})^{19}\text{F}$

See ([1983AJ01](#), [1984FR1A](#)) and ([1985HU04](#); theor.).

46.  $^{19}\text{F}(^{24}\text{Mg}, ^{24}\text{Mg})^{19}\text{F}$

See ([1983AJ01](#)). See also ([1984PE19](#), [1986BR1W](#), [1986PE1G](#)).

47. (a)  $^{19}\text{F}(^{27}\text{Al}, ^{27}\text{Al})^{19}\text{F}$   
 (b)  $^{19}\text{F}(^{28}\text{Si}, ^{28}\text{Si})^{19}\text{F}$   
 (c)  $^{19}\text{F}(^{30}\text{Si}, ^{30}\text{Si})^{19}\text{F}$

See ([1983AJ01](#)) and ([1984FR1A](#), [1984HA53](#), [1985ST1B](#), [1986BL08](#), [1986PE1G](#)) and ([1985OH01](#), [1986HA13](#); theor.).

48.  $^{19}\text{F}(^{40}\text{Ca}, ^{40}\text{Ca})^{19}\text{F}$

For fusion cross sections see ([1985RO01](#)). See also ([1983HE1B](#), [1984FR1A](#)).

See  $^{19}\text{Ne}$ .

See (1978AJ03).

See Table 19.23 in (1978AJ03).

At  $E_p = 45$  MeV  $^3\text{He}$  groups are observed to some  $T = \frac{1}{2}$  states in  $^{19}\text{F}$  and to  $^{19}\text{F}^*(7.66)$ , the  $\frac{3}{2}^+$   $T = \frac{3}{2}$  analog of  $^{19}\text{O}^*(0.095)$ : see reaction 12 in  $^{19}\text{Ne}$  and (1978AJ03).

The parity violating asymmetry of the 110 keV  $\gamma$ -rays emitted by polarized  $^{19}\text{F}^*$  nuclei is  $A_\gamma = -(6.8 \pm 2.1) \times 10^{-5}$  (1987EL03, 1982EL08). See also (1978AJ03).

See (1984NE1A).

*Ground state of  $^{19}\text{Ne}$ :* (1983BU07, 1983ANZQ, 1983AR1J, 1985AN28, 1985HA18, 1987BR1F).

$$\mu_{\text{g.s.}} = -1.88542 \text{ (8) nm (1982MA39)}$$

$$\mu_{0.239} = -0.740 \text{ (8) nm (1978LEZA)}$$

We adopt the half-life of  $^{19}\text{Ne}$  suggested by (1983AD03):  $17.34 \pm 0.09$  sec. See also (1978AJ03). The decay is principally to  $^{19}\text{F}_{\text{g.s.}}$ : see Table 19.23. The  $^{19}\text{Ne}$  decay to  $^{19}\text{F}^*(0.11)$  [ $J^\pi = \frac{1}{2}^+ \rightarrow \frac{1}{2}^-$ ] proceeds by vector and axial vector weak currents, with the former making a negligible contribution. The measured decay rates are roughly an order of magnitude smaller than predicted using the  $0\hbar\omega + 1\hbar\omega$  shell model (1981AD05, 1983AD03). The decay of polarized  $^{19}\text{Ne}$  is consistent with time-reversal invariance: see (1983SC32, 1984HA01). See also (1983AD1C, 1983AD1B, 1983AD1D, 1983VA01, 1984AD1E, 1984SI1G, 1985AD1A, 1985CA1P, 1985GR1A, 1986WI1P) and (1983CA03 [see for discussion of weak magnetism form factor and for search for heavy neutrinos], 1983GI1B, 1983VO05, 1984BO03, 1984HO1L, 1985GI09, 1986BR1X; theor.).

Table 19.21: Energy levels of  $^{19}\text{Ne}$ <sup>a</sup>

| $E_x$ (MeV $\pm$ keV) | $J^\pi; T$                     | $K^\pi$           | $\tau$ or $\Gamma_{\text{c.m.}}$ (keV)                 | Decay     | Reactions                       |

<sup>a</sup> See Table 19.26 in (1978AJ03) for additional data and for references.

<sup>b</sup>  $E_x = 238.27 \pm 0.11$ ,  $275.09 \pm 0.13$ ,  $1507.56 \pm 0.3$ ,  $1536.0 \pm 0.4$ ,  $1615.6 \pm 0.5$  and  $2794.7 \pm 0.6$  keV from  $E_\gamma$  measurements: see Table 19.25 in (1978AJ03).

<sup>c</sup>  $B(E1) = (1.06 \pm 0.05) \times 10^{-3}$  W.u.

<sup>d</sup>  $\Gamma_\gamma = 0.17 \pm 0.08$ ,  $24_{-8}^{+27}$ ,  $3.7_{-0.9}^{+1.8}$  and  $2.0_{-0.6}^{+1.3}$  meV: see Table 19.26 in (1978AJ03).

Gamma transitions have been observed from the first six excited states of  $^{19}\text{Ne}$ : see Table 19.25 in (1978AJ03) and Table 19.21 here. Angular distributions of many neutron groups have been studied at  $E_\alpha = 41$  MeV: see (1983AJ01).

This reaction and the mirror reaction  $^{16}\text{O}(^6\text{Li}, ^3\text{He})^{19}\text{F}$  have been studied at  $E(^6\text{Li}) = 24, 35, 36$  and  $46$  MeV: see (1978AJ03, 1983AJ01). Table 19.13 displays the analog states observed in the two reactions. In addition triton groups are reported to states with  $E_x = 6.08, 6.28, 6.85, 7.21, 8.08, 8.45, 8.94, 9.81, 10.01, 11.08, 11.24, 11.40, 12.56$  [all  $\pm 0.02$ ],  $13.1, 13.22, 14.18, 14.44, 14.78$  [remaining,  $\pm 0.03$ ] MeV. See also (1983CU02).

This as well as the analog reaction [ $^{16}\text{O}(^{10}\text{B}, ^7\text{Be})^{19}\text{F}$ ] have been studied at  $E(^{10}\text{B}) = 100$  MeV. On the basis of similar yields and  $E_x$ , and in addition to the low-lying analogs, it is suggested that the following pairs of states are analogs in  $^{19}\text{F}-(^{19}\text{Ne})$ :  $8.98$  ( $8.94$ ),  $11.33$  ( $11.09$ ),  $12.79$  ( $12.48$ ),  $14.15$  ( $14.17$ ),  $14.99$  ( $14.61$ ) and  $15.54$  ( $15.40$ ) [ $\pm 100$  keV]; however, problems of energy resolution are evident. See (1983AJ01) for references on this and on other heavy-ion induced reactions.

Neutron- $\gamma$  coincidence measurements lead to the determination of excitation energies [ $E_x = 4032.9 \pm 2.4, 4140 \pm 4, 4197.1 \pm 2.4, 4379.1 \pm 2.2, 4549 \pm 4, 4605 \pm 5, 4635 \pm 4$  and  $(5097 \pm 10)$  keV],  $\tau_m$  and branching ratios (see Table 19.21). On the basis of these it is suggested that  $^{19}\text{Ne}^*(4.14, 4.20)$  are the analogs of  $^{19}\text{F}^*(4.03, 4.00)$  [ $J^\pi = \frac{9}{2}^-, \frac{7}{2}^-$ ] and that  $^{19}\text{Ne}^*(4.55, 4.60)$  are the analogs of  $^{19}\text{F}^*(4.556, 4.550)$  [ $J^\pi = \frac{5}{2}^+, \frac{3}{2}^-$ ]. There is no evidence for a reported state at  $E_x = 4.78$  MeV: see (1978AJ03).

This reaction (at  $E_{\vec{p}} = 201$  MeV) selectively populates stretched 2p–1h states, in particular  $^{19}\text{Ne}^*(4.64)$  [ $J^\pi = \frac{13}{2}^+$ ] and a structure near 10 MeV. Angular distributions and  $A_y$  are reported for  $^{19}\text{Ne}^*(0, 2.80, 4.6)$  (1986KE04). See also (1982VI05), (1986JA1H) and (1984BEZZ; theor.).

<sup>b</sup>  $(2J+1)\Gamma_{^3\text{He}}\Gamma_\gamma = 30 \pm 17, 89 \pm 44, 18 \pm 4$  and  $17000 \pm 5300$  keV $^2$  for  $^{19}\text{Ne}^*(13.8, 14.9, 16.2, 18.4)$  (1983WA05).

$$Q_m = -4.0207$$

Neutron measurements are shown in Table 19.24 of ([1972AJ02](#)). Excited states of  $^{19}\text{Ne}$  determined from  $\gamma$ -spectra are displayed in Table 19.25 of ([1978AJ03](#)). Branching ratio and  $\tau_m$  measurements are summarized in Table [19.22](#) here. For the  $g$ -factor of  $^{19}\text{Ne}^*(0.24)$  see Table [19.21](#). Recently angular distributions have been measured at  $E_p = 160$  MeV to  $^{19}\text{Ne}^*(0[0], 1.54[(0+2)], 5.4[0], 6.2[(0+1)], 7.1[(0+1)], 7.7[(0+1)], 8.60[(0)], 10.2[(1)], 11.0[0], 12.1)$  ([1984RA22](#); [ $L$  in brackets] also forward  $\sigma(\theta)$  at  $E_p = 120$  MeV). See ([1984RA22](#), [1985WA24](#)) for discussions of the GT strengths. See also  $^{20}\text{Ne}$ , ([1983RA1C](#), [1984TAZS](#)) and ([1985BA66](#); applications).

$$Q_m = -3.2570$$

Angular distributions have been obtained for the triton groups to  $^{19}\text{Ne}^*(0.24, 1.54, 2.79)$  at  $E(^3\text{He}) = 26$  MeV: see ([1978AJ03](#)).

$$Q_m = 3.7092$$

Alpha groups have been observed to  $^{19}\text{Ne}$  states with  $E_x < 10.6$  MeV: see Tables [19.21](#) and [19.25](#). Angular distributions have been measured for  $E(^3\text{He}) = 10$  to 35 MeV: see ([1972AJ02](#)). DWBA analysis of the strongest transitions leads to the  $l$  and  $J^\pi$  values shown in Table [19.25](#).  $^{19}\text{Ne}^*(0, 0.24, 1.54, 2.79)$  are identified as members of the  $K = \frac{1}{2}^+$  rotational band [with  $^{19}\text{Ne}^*(4.38)$  as the  $\frac{7}{2}^+$  member] and  $^{19}\text{Ne}^*(0.28, 1.51, 1.62)$  with the  $K^\pi = \frac{1}{2}^-$  band. Candidates for the  $\frac{7}{2}^-$  and  $\frac{9}{2}^-$  members of the  $K = \frac{1}{2}^-$  band are thought to be  $^{19}\text{Ne}^*(4.15, 4.20)$ . Possible matching of other  $^{19}\text{Ne}$  states with those in  $^{19}\text{F}$  is also discussed: see ([1972AJ02](#)). For lifetime and radiative decay measurements see Table [19.21](#). See also ([1981CL05](#); theor.).

$$Q_m = 15.147$$

At  $E_p = 40$  MeV the angular distributions to  $^{19}\text{Ne}^*(0.24, 4.03, 5.09)$  are well described by  $L = 2, 0$  and  $4$ , respectively.  $^{19}\text{Ne}^*(4.03)$ ,  $J^\pi = \frac{3}{2}^+$ , has a dominant 5p–2h configuration.  $^{19}\text{Ne}^*(5.09)$  has  $\pi = +$  and its  $J$  is consistent with  $\frac{5}{2}$ . At  $E_p = 45$  MeV the triton group to a state with  $E_x = 7.620 \pm 0.025$  MeV has an angular distribution [ $L = 0$ ] which is similar to that for  $^{19}\text{F}^*(7.66)$ : both are thought to be the analogs of the  $(J^\pi; T) = (\frac{3}{2}^+; \frac{3}{2})$  0.096 MeV first excited state of  $^{19}\text{O}$ . The ground state of  $^{19}\text{O}$  has  $J^\pi = \frac{5}{2}^+$ ;  $L$  for the anaolg state should be 2.  $^{19}\text{Ne}^*(0, 2.79)$  are also populated: see ([1978AJ03](#), [1983AJ01](#)).

Table 19.25:  $^{19}\text{Ne}$  levels from  $^{20}\text{Ne}(^3\text{He}, \alpha)$ <sup>a</sup>

| $E_x$ (MeV $\pm$ keV) | $l_n$ | $J^\pi$                        | $E_x$ (MeV $\pm$ keV)        |
|-----------------------|-------|--------------------------------|------------------------------|
| 0                     | 0     | $\frac{1}{2}^+$                | 6.862 $\pm$ 7                |
| 0.23834 $\pm$ 0.15    | 2     | $\frac{5}{2}^+$                | 7.067 $\pm$ 9                |

| 6.742 $\pm$ 7         | 1     | $(\frac{3}{2}, \frac{1}{2})^-$ |                              |

<sup>a</sup> See Table 19.27 of (1978AJ03) for additional results and for a listing of the references.

<sup>b</sup> Unresolved states.

**$^{19}\text{Na}$**   
(Fig. 8)

A study of this nucleus via the  $^{24}\text{Mg}(^{3}\text{He}, ^{8}\text{Li})^{19}\text{Na}$  reaction at  $E(^3\text{He}) = 76.3$  MeV leads to an atomic mass excess of  $12.929 \pm 0.012$  MeV for  $^{19}\text{Na}$ ; it is then unstable with respect to breakup into  $^{18}\text{Ne} + \text{p}$  by  $321 \pm 13$  keV. An excited state at  $E_x = 120 \pm 10$  keV is also reported ([1975BE38](#), [1985WA02](#)). See also ([1985AN28](#), [1986AN07](#)) and ([1983ANZQ](#), [1983AU1B](#); theor.).

**$^{19}\text{Mg}$ , etc.**  
(Not observed)

See ([1977CE05](#)), ([1986AN07](#)) and ([1983ANZQ](#); theor.).
