**Abstract:** An evaluation of  $A = 18\text{--}19$  was published in *Nuclear Physics A595* (1995), p. 1. This version of  $A = 18$  differs from the published version in that we have corrected some errors discovered after the article went to press. The introduction and introductory tables have been omitted from this manuscript. Reference key numbers are in the NNDC/TUNL format.

## Table of Contents for $A = 18$

*Below is a list of links for items found within the PDF document. The introductory [Table 3](#) is available on this website via the link.*

**A. Nuclides:**  $^{18}\text{He}$ ,  $^{18}\text{Li}$ ,  $^{18}\text{Be}$ ,  $^{18}\text{B}$ ,  $^{18}\text{C}$ ,  $^{18}\text{N}$ ,  $^{18}\text{O}$ ,  $^{18}\text{F}$ ,  $^{18}\text{Ne}$ ,  $^{18}\text{Na}$ ,  $^{18}\text{Mg}$

**B. General Tables:**

[Table 18.1](#): General table for  $^{18}\text{C}$

[Table 18.3](#): General table for  $^{18}\text{N}$

[Table 18.8](#): General table for  $^{18}\text{O}$

[Table 18.23](#): General table for  $^{18}\text{F}$

[Table 18.35](#): General table for  $^{18}\text{Ne}$

**C. Tables of Recommended Level Energies:**

[Table 18.2](#): Energy levels of  $^{18}\text{C}$

[Table 18.4](#): Energy levels of  $^{18}\text{N}$

[Table 18.9](#): Energy levels of  $^{18}\text{O}$

[Table 18.24](#): Energy levels of  $^{18}\text{F}$

[Table 18.36](#): Energy levels of  $^{18}\text{Ne}$

**D. References**

**E. Figures:**  $^{18}\text{N}$ ,  $^{18}\text{O}$ ,  $^{18}\text{F}$ ,  $^{18}\text{Ne}$ , Isobar diagram

**F. Erratum to the Publication:** [PS](#) or [PDF](#)

**$^{18}\text{He}$**   
(Not illustrated)

Not observed: See ([1982AV1A](#), [1983ANZQ](#)).

**$^{18}\text{Li}$**   
(Not illustrated)

$^{18}\text{Li}$  has not been observed. Shell model calculations described in ([1988POZS](#)) predict the ground-state magnetic dipole moment and charge and matter radii.

**$^{18}\text{Be}$**   
(Not illustrated)

$^{18}\text{Be}$  has not been observed. It is predicted to have a mass excess of 78.43 MeV: see ([1978AJ03](#)).  $^{18}\text{Be}$  is then unstable with respect to breakup into  $^{16}\text{Be} + 2\text{n}$ ,  $^{15}\text{Be} + 3\text{n}$ ,  $^{14}\text{Be} + 4\text{n}$ ,  $^{13}\text{Be} + 5\text{n}$ ,  $^{12}\text{Be} + 6\text{n}$ ,  $^{11}\text{Be} + 7\text{n}$  and  $^{10}\text{Be} + 8\text{n}$  by, respectively 3.01, 3.04, 6.26, 2.92, 4.93, 1.76 and 1.26 MeV, using the masses for the residual nuclei adopted by ([1991AJ01](#), [1993AU05](#), [1993TI07](#)). See also ([1983ANZQ](#), [1989OG1B](#)).

**$^{18}\text{B}$**   
(Not illustrated)

$^{18}\text{B}$  has not been observed in the bombardment of Ta by 44 MeV/A Ar ions ([1985DE60](#), [1985LA03](#), [1986PO13](#)) or in the bombardment of Be by 12 MeV/A  $^{56}\text{Fe}$  ions ([1984MU27](#)).  $^{18}\text{B}$  has been predicted to have a mass excess of 52.3 MeV ([1993AU05](#)). It would then be unstable with respect to  $^{17}\text{B} + \text{n}$  by 0.5 MeV: see ([1978AJ03](#), [1985WA02](#)).  $^{18}\text{B}$  is calculated to have  $J^\pi = 4^-$  and to have excited states at 0.62, 0.86 and 1.59 MeV with  $J^\pi = 1^-, 2^-$  and  $2^-$  ([1985PO10](#)). The shell model calculations of ([1992WA22](#)) predict  $J^\pi = 2^-$  for the ground state with the first three excited states at 0.45, 0.52, 0.839 MeV with  $J^\pi = 4^-, 2^-, 3^-$ . See also ([1987AJ02](#), [1988GUZT](#)).

**$^{18}\text{C}$**   
(Figs. 1 and 5)

GENERAL: See Table [18.1](#).

*Mass of  $^{18}\text{C}$ :* The atomic mass excess of  $^{18}\text{C}$  adopted by ([1993AU05](#)) is  $24.920 \pm 0.030$  MeV, based on the  $Q$ -value of the  $^{48}\text{Ca}(^{18}\text{O}, ^{18}\text{C})^{48}\text{Ti}$  reaction.  $^{18}\text{C}$  is then bound by 4.188 MeV with respect to breakup into  $^{17}\text{C} + \text{n}$ . See also ([1982FI10](#), [1987AJ02](#), [1992WA22](#)).

The half-life of  $^{18}\text{C}$  has been measured to be  $66_{-18}^{+25}$  ms ([1988MU08](#)),  $78_{-15}^{+20}$  ms ([1989LE16](#)),  $94 \pm 27$  ms ([1991RE02](#)),  $(95 \pm 10)$  ms ([1991PR03](#)).

Branching to states in  $^{18}\text{N}$  has been measured by ([1991PR03](#)) and is presented here in Table 18.6. These authors also measured the total branching probability to gamma emitting states plus the ground state of  $^{18}\text{N}$  to be  $P_\gamma = (81 \pm 5)\%$ . The  $\beta$ -delayed neutron emission probability is  $P_n = 1 - P_\gamma = (19 \pm 5)\%$ . Other values reported for  $P_n$  are  $(25 \pm 4.5)\%$  ([1988MU08](#)),  $(50 \pm 10)\%$  ([1989LE16](#)),  $(43.3 \pm 6.5)\%$  ([1991RE02](#)). The  $^{18}\text{C}(\beta^-)$  decay is also discussed in the analysis of Gamow-Teller rates presented in ([1993CH06](#)). Experimental Gamow-Teller matrix elements are compared with results of shell-model calculations.

Table 18.2: Energy levels of  $^{18}\text{C}$

$E_x$ in $^{18}\text{C}$ (MeV $\pm$ keV)	$J^\pi; T$	$\tau_{1/2}$ (ms)	Decay	Reactions
0	$(0^+); 3$	$95 \pm 10$	$(\beta^-)$	2, 3
$1.62 \pm 20$	$(2^+); 3$			2, 3

The angular distribution of the  $\pi^+$  to the ground state of  $^{18}\text{C}$  has been measured at  $E_{\pi^-} = 164$  MeV by (1984GI10) [see also for excitation function at  $\theta = 5^\circ$  for  $E_{\pi^-} \approx 140$  to 240 MeV]. There is also some indication of the population of an excited state at  $E_x = 1.55$  MeV (1984GI10). See also (1983AJ01).

At  $E(^{18}\text{O}) = 112$  MeV the ground state and an excited state at  $1.62 \pm 0.024$  MeV are observed by (1982FI10). See also (1983AJ01).

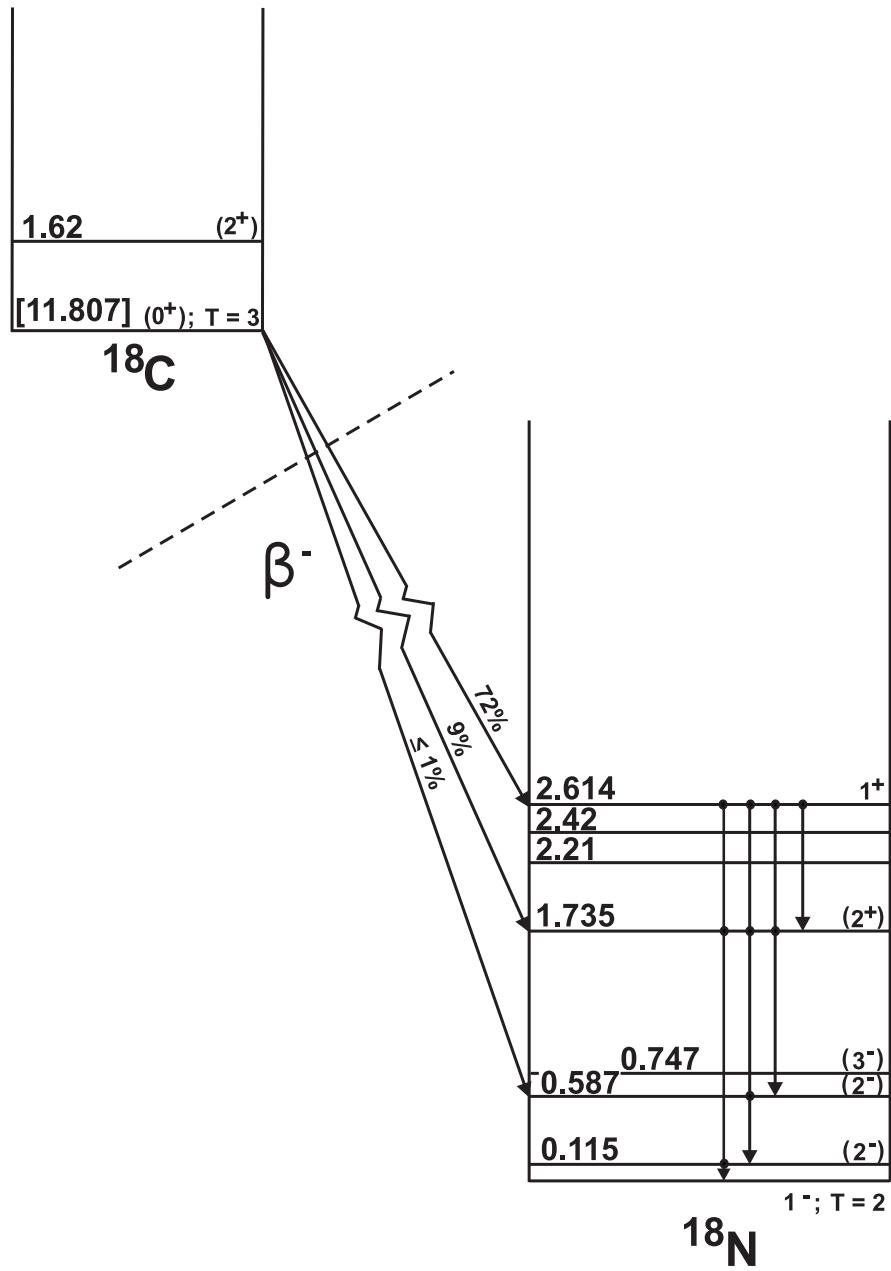

$^{18}\text{N}$   
(Figs. 1 and 5)

GENERAL: See Table 18.3.

*Mass of  $^{18}\text{N}$ :* The atomic mass excess derived from the  $Q$ -value of the  $^{18}\text{O}(^7\text{Li}, ^7\text{Be})^{18}\text{N}$  reaction and adopted by (1993AU05) is  $13.117 \pm 0.020$  MeV (1983PU01).  $^{18}\text{N}$  is then stable with respect to breakup into  $^{17}\text{N} + \text{n}$  by 2.825 MeV. See (1983AJ01) for the earlier work.

The half-life of  $^{18}\text{N}$  is  $0.624 \pm 0.012$  s (1982OL01). The decay branches are displayed in Table 18.18. The nature of the decay leads to  $J^\pi = 1^-$  for the  $^{18}\text{N}$  ground state (1982OL01). See also (1983SN03), and see the measurements on beta branching reported in (1989ZH04) which indicate a total branching ratio to alpha-particle-emitting states in  $^{18}\text{O}$  of at least 12.2%. A delayed-neutron emission probability  $P_n = (14.3 \pm 2.0)\%$  was measured by (1991RE02). More recently a study reported by (1994SC01) gave  $P_n = (2.2 \pm 0.4)\%$  for transitions to neutron unstable states in  $^{18}\text{O}$  above  $E_x = 9.0$  MeV. See also reaction 22 under  $^{18}\text{O}$ .

06-2013

Fig. 1: Energy levels of  $^{18}\text{C}$  and  $^{18}\text{N}$ . For notation see Fig. 2. For more detailed  $\beta^-$  branching information see  $^{18}\text{C}$  reaction 1.

The preliminary work described in ([1983AJ01](#)) has not been published.

At  $E(^{18}\text{O}) = 92.2$  MeV groups are observed to the ground state of  $^{18}\text{N}$  (unresolved) and to an excited state at  $E_x = 575 \pm 25$  keV ([1980NA14](#)).

See reaction 1 under  $^{18}\text{C}$ . Branching to states in  $^{18}\text{N}$  was measured by ([1991PR03](#)) and is presented here in Table 18.6. These authors measured the total branching probability to gamma emitting states of  $^{18}\text{N}$  to be  $P_\gamma = 81 \pm 5$  %. Measurements of  $\gamma$ -ray energies and branching lead to the level energies displayed in Table 18.7 and  $^{18}\text{N}$  radiative decays in Table 18.5.

Table 18.4: Energy levels of  $^{18}\text{N}$ 

$E_x(\text{MeV} \pm \text{keV})$	$J^\pi; T$	$\tau_{1/2} (\text{ms})$	Decay	Reactions
0	$1^-; 2$	$624 \pm 12$	$\beta^-$	1, 3, 5, 6, 7
$0.11490 \pm 0.18$ <sup>a</sup>	$(2^-)$ <sup>b</sup>		$\gamma$	3, 4, 5, 7
$0.58756 \pm 0.24$	$(2^-)$ <sup>b</sup>		$\gamma$	3, 4, 7, 8
$0.747 \pm 10$	$(3^-)$ <sup>b</sup>			7
	c			
$1.73485 \pm 0.22$ <sup>a</sup>	$(2^+)$ <sup>d</sup>		$\gamma$	4
2.21				7
2.42				7
$2.61445 \pm 0.23$ <sup>a</sup>	$1^+$ <sup>a,d</sup>		$\gamma$	4

<sup>a</sup> Level energies determined from  $\gamma$  energies reported in (1991PR03).

<sup>b</sup> Suggested by (1984BA24). See also (1982OL01).

<sup>c</sup> See (1984BA24) for a calculation suggesting additional states in this energy region.

<sup>d</sup> (1993CH06).

 Table 18.5: Radiative decays in  $^{18}\text{N}$  <sup>a</sup>

$E_i(\text{MeV})$	$J_i^\pi$	$E_f(\text{MeV})$	Branch (%)
0.115	$(2^-)$	0	100
0.587	$(2^-)$	0.115	$100 \pm 16$
1.735	$(2^+)$	0	$33 \pm 8$
		0.115	$38 \pm 9$
		0.587	$29 \pm 10$
2.614	$1^+$	0	$49 \pm 8$
		0.115	$22 \pm 6$
		0.587	$3 \pm 2$
		1.735	$26 \pm 6$

<sup>a</sup> (1991PR03).

Table 18.6: Branchings in  $^{18}\text{C}(\beta^-)^{18}\text{N}$

Decay to $^{18}\text{N}^*$ (MeV)	Branch <sup>a</sup> (%)	$\log ft$ <sup>b</sup>
0.115		
0.587	$\leq 1$	$\geq 6.4$
1.735	$9 \pm 7$	$5.2 \pm 0.4$
2.614	$72 \pm 10$	$4.08 \pm 0.08$

<sup>a</sup> (1991PR03), calculated with the hypothesis that there is no direct  $\beta$ -feeding of the 0.115 MeV level. The total probability of  $\beta$  decay to gamma emitting states plus to the ground state is  $P_\gamma = (81 \pm 5)\%$ . The  $\beta$ -delayed neutron probability is  $P_n = 1 - P_\gamma$ .

<sup>b</sup>  $\log ft$ 's were recalculated by evaluators and are slightly different from those in (1991PR03) due to use of level energies from Table 18.4 and  $Q$ -values from (1993AU05).

Table 18.7:  $\gamma$ -ray intensities in  $^{18}\text{C}(\beta^-)^{18}\text{N}$  <sup>a</sup>

$E_\gamma$ (keV)	$E_i$ (keV)	$E_f$ (keV)	$I_\gamma$ <sup>b</sup>
$114.9 \pm 0.2$	115	0	$36.5 \pm 7.5$
$472.7 \pm 0.2$	587	115	$10.2 \pm 4.0$
$879.7 \pm 0.2$	2614	1735	$18.7 \pm 5.0$
$1147.8 \pm 0.4$	1735	587	$8.0 \pm 3.7$
$1619.9 \pm 0.3$	1735	115	$10.5 \pm 4.1$
$1734.8 \pm 0.4$	1735	0	$9.1 \pm 3.6$
$2025.3 \pm 0.8$	2614	587	$2.2 \pm 1.5$
$2499.3 \pm 0.4$	2614	115	$15.8 \pm 4.8$
$2614.2 \pm 0.4$	2614	0	$35.3 \pm 7.6$

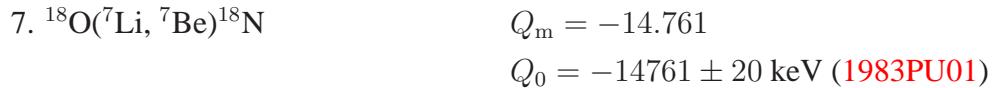

<sup>a</sup> (1991PR03).

<sup>b</sup>  $\gamma$ -ray intensities are per 100 parent decays.

See ([1983AS01](#), [1984AS05](#)).

See ([1983AJ01](#)).

At  $E(^7\text{Li}) = 52 \text{ MeV}$ ,  $^7\text{Be}$  groups are observed corresponding to the excitation of the states displayed in Table 18.4 here ([1983PU01](#)).

See ([1983PU01](#)).

**<sup>18</sup>O**  
(Figs. 2 and 5)

GENERAL: See Table 18.8.

Isotopic abundance =  $(0.200 \pm 0.012)\%$  (1984DE53).  
 $\langle r^2 \rangle^{1/2} = 2.784 \pm 0.020$  fm: see reaction 25.

<sup>18</sup>O\*(1.98)

$g = -0.287 \pm 0.015$  [see (1983AJ01)].

$Q = -0.042 \pm 0.008$  b. [weighted mean of  $-0.036 \pm 0.009$  and  $-0.058 \pm 0.015$  b: see (1983GR28); see also (1983AJ01)].

$$\begin{aligned} B(E2; 0^+ \rightarrow 2^+) &= 39.0 \pm 1.8 e^2 \cdot \text{fm}^4 [(1979FE06, 1983GR10); \text{ see also (1983AJ01)}]; \\ &= 44.8 \pm 1.3 e^2 \cdot \text{fm}^4 (1982NO04); \\ &= 47.6 \pm 1.0 e^2 \cdot \text{fm}^4 (1982BA06); \text{ see also (1987RA01)}. \end{aligned}$$

For a discussion of the hexadecapole deformation see (1983GR10). See also (1987RA01).

1. (a) ${}^7\text{Li}({}^{11}\text{B}, \text{nn}){}^{16}\text{O}$	$Q_m = 12.171$
(b) ${}^9\text{Be}({}^9\text{Be}, \text{nn}){}^{16}\text{O}$	$Q_m = 11.291$

Reactions (a) and (b) have been studied by (1993CU01, 1993DA17) in low energy heavy-ion fusion reactions. It is reported that the  $\approx 3$  MeV wide resonance observed at  $E_x({}^{18}\text{O}) \approx 28$  MeV in the  ${}^7\text{Li} + {}^{11}\text{B} \rightarrow {}^{18}\text{O} \rightarrow {}^{16}\text{O} + \text{nn}$  and  ${}^9\text{Be} + {}^9\text{Be} \rightarrow {}^{18}\text{O} \rightarrow {}^{16}\text{O} + \text{nn}$  reactions overlap with the higher part of the  $T_< = 1, {}^{18}\text{O}$  GDR observed in photonuclear excitation.

---

Fig. 2: Energy levels of <sup>18</sup>O. In these diagrams, energy values are plotted vertically in MeV, based on the ground state as zero. Uncertain levels or transitions are indicated by dashed lines; levels which are known to be particularly broad are cross-hatched. Values of total angular momentum  $J$ , parity, and isobaric spin  $T$  which appear to be reasonably well established are indicated on the levels; less certain assignments are enclosed in parentheses. For reactions in which <sup>18</sup>O is the compound nucleus, some typical thin-target excitation functions are shown schematically, with the yield plotted horizontally and the bombarding energy vertically. Bombarding energies are indicated in laboratory coordinates and plotted to scale in cm coordinates. Excited states of the residual nuclei involved in these reactions have generally not been shown; where transitions to such excited states are known to occur, a brace is sometimes used to suggest reference to another diagram. For reactions in which the present nucleus occurs as a residual product, excitation functions have not been shown; a vertical arrow with a number indicating some bombarding energy, usually the highest, at which the reaction has been studied, is used instead. Further information on the levels illustrated, including a listing of the reactions in which each has been observed, is contained in the master table, entitled “Energy levels of <sup>18</sup>O”. For more detailed  $\beta^-$  branching information, see <sup>18</sup>N reaction 1.

(A) denotes that only an abstract is available for this reference.

$$\begin{array}{ll} 2. \text{ (a)} ^{10}\text{B}(^9\text{Be}, \text{p})^{18}\text{O} & Q_m = 16.892 \\ \text{(b)} ^{11}\text{B}(^9\text{Be}, \text{d})^{18}\text{O} & Q_m = 7.662 \end{array}$$

See (1986CU02) for production cross sections of 1.98 MeV  $\gamma$ -rays.

$$3. ^{12}\text{C}(^7\text{Li}, \text{p})^{18}\text{O} \quad Q_m = 8.401$$

Observed proton groups are displayed in Table 18.5 od (1987AJ02). See also (1983AJ01). In a recent experiment, the  $4^+$  state at 7117 keV in  $^{18}\text{O}$  was studied by (1994ME02) and an E2 strength for the 7117–5060 branches of  $B(\text{E}2) = 6.4 \pm 1.6$  W.u. was deduced in agreement with results of (1989GA01). It was concluded that it is highly improbable that the 7117 keV state is energetically degenerate with a state of different decay properties.

$$4. ^{13}\text{C}(^6\text{Li}, \text{p})^{18}\text{O} \quad Q_m = 10.704$$

See (1986SM01) and Table 18.5 in (1987AJ02). It is noted there that existing data indicate that when  $\sigma_{\text{tot}}$  to a particular state in  $^{18}\text{O}$  is large in this reaction, it is also large in the  $^{12}\text{C}(^7\text{Li}, \text{p})$  reaction. More recent data are reported in (1988SM01) (see Table 18.11 here). Differential cross sections were measured and compared with results of Hauser-Feshbach calculations. The results suggest the presence of an additional non-statistical mechanism.

<sup>a</sup> See also Table 18.11. For references see Table 18.5 in (1978AJ03).

<sup>b</sup> (1987GA15):  $\Gamma_\gamma = 0.095 \pm 0.020, 0.41 \pm 0.08, 0.043 \pm 0.009, 1.07 \pm 0.22, 0.27 \pm 0.05, 0.41 \pm 0.09$ , and  $0.49 \pm 0.13$  eV, respectively for  $^{18}\text{O}^*(7.11, 7.62, 7.86, 8.04, 8.13, 8.21, 8.28$  MeV).

<sup>c</sup>  $\pm 10 - 20$  keV for this and all higher resonances (G.E. Mitchell, private communication).

<sup>d</sup>  $\Gamma_\alpha$ , large;  $\Gamma_n$ , large.

<sup>e</sup>  $\Gamma_\alpha$ , small;  $\Gamma_n$ , small.

<sup>f</sup>  $\Gamma_\alpha$ , small;  $\Gamma_n$ , large.

<sup>g</sup>  $\Gamma_\alpha$ , large;  $\Gamma_n$ , small.

<sup>h</sup> Recent  $^{14}\text{C}(\alpha, \gamma)$  measurements for these two  $1^-$  states by (1994HA17) gave  $E_x = 7.6159 \pm 0.0007$  and  $8.0378 \pm 0.0007$  keV.

Resonances in the yield of capture  $\gamma$ -rays are observed at  $E_\alpha = 1.14, 1.79, 2.09, 2.33, 2.44, 2.55$ , and  $2.64$  MeV: see Tables 18.12 here and 18.5 in (1978AJ03). Gamma-ray angular distribution and correlation measurements lead to  $J^\pi = 4^+, 1^-, 1^-$ , and  $5^-$  for  $^{18}\text{O}^*(7.11, 7.62, 8.04, 8.13)$ , as well as to  $J^\pi$  assignments for lower states involved in the cascade decay. See also references in (1987AJ02) and see the cross section measurements of (1993DA17). The speculated presence of enhanced E1  $\gamma$  de-excitation in  $^{18}\text{O}$  (1983GA02) was followed by further experimental and theoretical investigations of collective band structure in  $^{18}\text{O}$  (1989FU08, 1993RE03). See however (1986HA1J). See also (1989FU1H, 1989KAZH). The  $4_2^+ \rightarrow 2_2^+$  ( $7117 \rightarrow 5260$ ) keV  $\gamma$  branching ratio of  $0.30 \pm 0.08\%$  was measured by (1989GA01) and an E2 transition strength  $B(E2) = 5.7 \pm 1.9$  W.u. was deduced. This result is conformed by the  $(\Gamma_{\alpha X} \Gamma \gamma)/(\Gamma_\alpha + \Gamma_\gamma)$  and ( $7117 \rightarrow 5260$ ) keV  $\gamma$  branching ( $0.24 \pm 0.08\%$ ) measurements of (1992GO14) and the  $\Gamma_\gamma/\Gamma_\alpha$  measurement of (1994ME02).

The  $^{14}\text{C}(\alpha, \gamma)$  reaction is important in astrophysical processes and the details of the cross section are relevant to the process of heavy element formation in inhomogeneous big bang nucleosynthesis (1988AP1A, 1989FU06, 1990WIZP, 1992GA11, 1992GO14). See also (1988BU01, 1988MA1U, 1989KA1K, 1989NO1A, 1989TH1C) and the review of thermonuclear reaction rates in (1988CA26).

$$8. (a) ^{14}\text{C}(\alpha, \alpha')^{14}\text{C} \quad E_b = 6.227 \\ (b) ^{14}\text{C}(\alpha, n)^{17}\text{O} \quad Q_m = -1.817$$

Observed anomalies in the scattering [reaction (a)] for  $E_\alpha = 2$  to  $8.2$  MeV and the resonances in the relative neutron yield [reaction (b)] for  $E_\alpha = 2.3$  MeV are displayed in Table 18.12. See also (1978AJ03).

The  $\alpha$ -cluster structure of  $^{18}\text{O}$  has been investigated in theoretical work of (1989FU08, 1993RE03) based on  $^{14}\text{C}(\alpha, \alpha)$  scattering, and the results do not support the existence of proposed negative-parity molecular dipole states. See (1989GA01).

9. (a)  $^{14}\text{C}(^{6}\text{Li}, \text{d})^{18}\text{O}$        $Q_m = 4.752$   
 (b)  $^{14}\text{C}(^{6}\text{Li}, \text{d}\alpha)^{14}\text{C}$        $Q_m = -1.475$

<sup>a</sup> (1987GA15). See also Table 18.12 for measured  $\Gamma_\gamma$  for these levels.

At  $E(^6\text{Li}) = 34$  MeV angular distributions have been measured for the deuteron groups to many states of  $^{18}\text{O}$  (1981CU07) [see also (1983AJ01)] including  $^{18}\text{O}^*(17.6 \pm 0.2)$  (1982CU01).  $J^\pi = 4^+, 2^+, 2^-, (4^+)$ , and  $(4^+)$  are suggested for  $^{18}\text{O}^*(7.86, 8.9, 12.04, 14.6, 17.0)$  (1981CU07). The  $2^+, 4^+, 6^+$  and  $8^+$  members of the  $K^\pi = 0_2^+$  rotational band based on  $^{18}\text{O}^*(3.62)$  are  $^{18}\text{O}^*(5.26, 7.12, 11.69, 17.6)$  (1982CU01).

Angular correlations have been measured at  $E(^6\text{Li}) = 34$  MeV; these lead to the assignment of  $J^\pi = 8^+$  to  $^{18}\text{O}^*(17.6)$  (1982CU01) and to the assignment of  $J^\pi = 4^+, 5^-, 6^+, 7^-$  and  $8^+$  to sixteen states in  $^{18}\text{O}$  with  $11.4 \leq E_x \leq 23.1$  MeV (1983CU03) [see (1983CU03) for assignment of  $^{18}\text{O}$  states to bands]. At  $E(^6\text{Li}) = 32$  MeV (1983AR11) find that the strongest groups are those to (unresolved) structures at  $E_x = 17.05$  and  $18.95$  MeV [each  $\Gamma \approx 0.35$  MeV] dominated by  $J^\pi = 7^-$ .  $^{18}\text{O}^*(11.6, 12.6)$  with  $J^\pi = (6^+, 5^-)$  and  $5^-$  are also observed (1983AR11) [see, however, the density of states]. See also (1987AJ02, 1990OS03).

At  $E(^7\text{Li}) = 20.4$  MeV, triton groups are observed corresponding to a number of states of  $^{18}\text{O}$  with  $E_x < 12.6$  MeV. Angular distributions were obtained for some of these, including  $^{18}\text{O}^*(0, 1.98, 7.12, 11.69)$  with  $J^\pi = 0^+, 2^+, 4^+, 6^+$ . The latter two are the most strongly populated in this reaction: they appear to be part of the ground-state rotational band: see (1972AJ02). See also (1987AJ02).

In more recent work at  $E(^7\text{Li}) = 15$  MeV,  $^{18}\text{O}$  gamma de-excitation modes for all natural parity states up to the alpha-particle threshold at  $E_x = 6.227$  MeV were studied (1991GA08). See Table 18.14.

Table 18.14: Gamma decay branching ratios for  $^{18}\text{O}$  from  $^{14}\text{C}(^7\text{Li}, t\gamma)^{18}\text{O}$ <sup>a</sup>

$7123 \pm 7$	4	$4^+$	$9671 \pm 8$	

<sup>a</sup> ([1981CO13](#)):  $E_t = 15$  MeV; DWBA analysis. See also Table 18.6 in ([1978AJ03](#)).

<sup>b</sup> Nominal energy.

<sup>c</sup> See, however, Table [18.18](#).

<sup>d</sup> Comparisons of  $E_x$  shown here with those displayed in Table [18.3](#) for  $^{18}\text{O}^*(3.92, 5.10, 6.40, 7.77)$  suggest that the uncertainty shown may be low:  $\pm 6$  keV was arbitrarily used in calculating the best value for  $E_x$  for this state in Table 18.3 of ([1987AJ02](#)).

<sup>e</sup> This is the “average” of several unresolved levels. ([1985FO11](#)) states that the main components are at 8.96 and 9.03 MeV. [Comment: It is not clear whether these states are actually resolved ([1987AJ02](#)).]

Several states in  $^{18}\text{O}$  at  $E_x = 10\text{--}25$  MeV were observed in  $^{15}\text{N}(\alpha, \text{p})$  experiments reported in ([1987MIZY](#), [1988BRZY](#), [1989BR1J](#)).

See ([1983AJ01](#)).

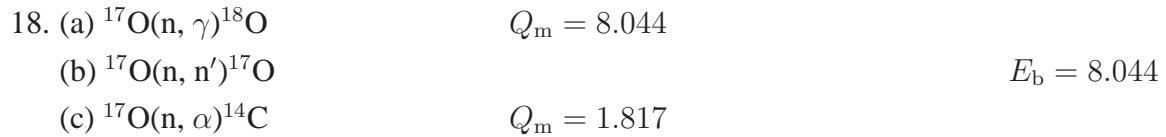

Proton groups corresponding to states of  $^{18}\text{O}$  are displayed in Table 18.15 here [1981CO13](#)). See ([1976LA13](#)) for a general discussion of the properties of the states of  $^{18}\text{O}$ . Lifetime measurements are reported in Table 18.4 of ([1978AJ03](#)). See also reaction 19 and ([1982AN12](#), [1985AN17](#), [1985BA1A](#)).

At  $E_\alpha = 65$  MeV, the angular distribution to  $^{18}\text{O}^*(3.55)$  [ $J^\pi = 4^+$ ] has been studied.  $^{18}\text{O}^*(8.04, 9.15, 10.3)$  are also populated: see ([1983AJ01](#)).

At  $E({}^{10}\text{B}) = 100$  MeV,  $^{18}\text{O}^*(3.55)$  [first  $(\text{d}_{5/2})_{4+}^2$  state] is preferentially populated.  $^{18}\text{O}^*(1.98, 5.26, 7.12, 8.0, 8.3, 9.1)$  are also observed. The angular distribution to  $^{18}\text{O}^*(3.55)$  has been measured at  $E({}^{13}\text{C}) = 105$  MeV. See ([1983AJ01](#), [1983OS07](#)).

For reaction (a) see (1983AJ01). [The work reported there has not been published.] The scattering amplitude (bound)  $a = 5.62 \pm 0.45$  fm,  $\sigma_{\text{free}} = 3.55 \pm 0.25$  b. The thermal cross section for reaction (c) is  $235 \pm 10$  mb. See (1983AJ01) for references. See also (1988MCZT).

In more recent work, the cross section for  $^{17}\text{O}(\text{n}, \alpha)$  has been measured from  $E_{\text{n}} = 25 \times 10^{-3}$  eV to 1 MeV (1991KO31). An evaluation of the cross sections from  $E_{\text{n}} = 10^{-5}$  eV to 20 MeV has been carried out by (1991HI15). Results are given in tabular and graphical form. See also (1991KO1P).

Table 18.16: States of  $^{18}\text{O}$  from  $^{17}\text{O}(\text{d}, \text{p})$ <sup>a</sup>

8.82	$(1^+)$	0.04
11.06 <sup>a</sup>	$(6^-)$ <sup>a</sup>	0.18
13.85	$(6^-)$ <sup>d</sup>	0.02
14.17	$(6^-)$ <sup>d</sup>	0.01

<sup>a</sup> (1992YA08);  $E_\alpha = 65$  MeV.

<sup>b</sup>  $E_x$  and  $J^\pi$  values from Table (18.9).

<sup>c</sup> Integrated cross section. See Tables III and IV in (1992YA08) for spectroscopic factors.

<sup>d</sup> (1990SEZZ).

Observed proton groups are displayed in Table 18.16. A strong asymmetric peak is observed at  $E_d = 12$  MeV corresponding to  $E_x = 9.0$  MeV. On the basis of this work and the measurement of the cross section at a peak at about the same energy observed in the  $^{16}\text{O}(t, p)$  reaction, (1985FO11) assign  $J^\pi = 4^+$  and a  $(1d_{5/2})(1d_{3/2})$  configuration to  $^{18}\text{O}^*(9.0)$ . Proton- $\gamma$  coincidence measurements are shown in Table 18.10.

$$20. {}^{17}\text{O}(\alpha, {}^3\text{He}){}^{18}\text{O} \quad Q_m = -12.533$$

Differential cross sections were measured at  $E_\alpha = 65$  MeV (1992YA08) for  $^{18}\text{O}$  states up to  $E_x = 15$  MeV. DWBA analysis led to proposed spin parity and isospin assignments, and spectroscopic factors. See Table 18.17.

$$21. {}^{17}\text{O}({}^{12}\text{C}, {}^{11}\text{C}){}^{18}\text{O} \quad Q_m = -10.677$$

Angular distributions involving  $^{18}\text{O}^*(0, 1.98, 3.55)$  have been studied at  $E({}^{12}\text{C}) = 115$  MeV; see (1983AJ01).

Table 18.18: Branching in  $^{18}\text{N}(\beta^-)^{18}\text{O}$  <sup>a</sup>

Decay to $^{18}\text{O}^*$ (keV)	Decay mode	$J^\pi$	Branch <sup>b</sup> (%)	$\log ft$

<sup>a</sup> Branchings to  $\gamma$ -decaying levels ([1982OL01](#)), branchings to  $\alpha$ -decaying levels ([1989ZH04](#)) and branchings to n-decaying levels ([1994SC01](#)).

<sup>b</sup>  $12.2 \pm 0.6\%$  of the  $\beta$ -decay branching ratio has been measured to feed  $\alpha$ -emitting states ([1989ZH04](#)).  $14.3 \pm 2.0\%$  has been measured to feed n-decaying states ([1991RE02](#)). The branching ratio of  $\gamma$ -decaying states ([1982OL01](#)) have been renormalized to take these values into account. See reaction 22 of  $^{18}\text{O}$ . Branchings in this table do not add up to 100% since n-decaying levels below 9.00 MeV were not measured by ([1994SC01](#)) and there is a missing 12.1% branching to n-decaying levels not listed.

<sup>c</sup>  $E_\gamma = 1981.933 \pm 0.09$  keV is adopted by ([1982OL01](#)).

<sup>d</sup> See ([1982OL01](#)).

<sup>e</sup> Found as a broad bump at 3 MeV in  $\beta$ -delayed alpha spectrum. Could be several unresolved  $1^-$  states or a new broad  $1^-$  state in  $^{18}\text{O}$  ([1989ZH04](#)).

$$22. \ ^{18}\text{N}(\beta^-)^{18}\text{O} \quad Q_m = 13.899$$

The transitions observed in the  $\beta^-$  decay are displayed in Table 18.18.

The  $\gamma$ -decaying states were measured by (1982OL01) and estimated  $15 \pm 6\%$  branching to non- $\gamma$ -decaying states in  $^{18}\text{O}$  was assumed. At least  $12.2 \pm 0.6\%$  of the  $\beta$ -decay branching ratio has been measured to feed  $1^-$  alpha-particle emitting states (1989ZH04). See also the measurements of (1987GAZW, 1987ZHJV, 1988MI1G). A  $\beta$ -delayed neutron emission probability of  $14.3 \pm 2.0\%$  has been measured (1991RE02). The  $\beta^-$  branchings to  $\gamma$ -emitting states of (1982OL01) has been renormalized to take in account the  $26.5 \pm 2.1\%$  branches to particle emitting states. The  $\gamma$ -ray intensities of (1982OL01) also need to be renormalized by this factor, see Table 18.19. (1994SC01) has measured  $\beta$  decay branching ratios to 9 neutron emitting states in  $^{18}\text{O}$  listed in Table 18.18 for a total of  $2.2 \pm 0.4\%$ .

23. (a) $^{18}\text{O}(\gamma, \text{n})^{17}\text{O}$	$Q_m = -8.044$
(b) $^{18}\text{O}(\gamma, 2\text{n})^{16}\text{O}$	$Q_m = -12.187$
(c) $^{18}\text{O}(\gamma, \text{p})^{17}\text{N}$	$Q_m = -15.942$
(d) $^{18}\text{O}(\gamma, \text{t})^{15}\text{N}$	$Q_m = -15.834$
(e) $^{18}\text{O}(\gamma, \text{pn} + \text{np})^{14}\text{C}$	$Q_m = -34.522$
(f) $^{18}\text{O}(\gamma, \alpha)^{14}\text{C}$	$Q_m = -6.227$

The cross sections for the ( $\gamma$ , p), ( $\gamma$ , n), ( $\gamma$ , 2n) and ( $\gamma$ , tot) [tot = total absorption] have been measured with monoenergetic photons to 42 MeV: observed resonances are displayed in Table 18.20. All three of the partial cross sections have substantial strength in the giant resonance region; the ( $\gamma$ , 2n) cross section is a significant fraction of  $\sigma(\gamma, \text{tot})$  and is even larger than  $\sigma(\gamma, \text{p})$ . Above the GDR the partial cross sections decrease. The integrated  $\sigma(\gamma, \text{tot})$  between 29 and 42 MeV is about one-third of the value integrated from threshold to 42 MeV. The relative strengths of partial cross sections leads to the  $T$  assignments shown in Table 18.20. The  $T_<$  and  $T_>$  components of the  $^{18}\text{O}$  photo absorption cross section are also derived (1979WO04).

In a related, but more recent, experiment the cross section for reaction (e) was measured (1991MC01) and it was determined that the cross section rises to a maximum of 1.2 mb at 27.5 MeV, approximately one-tenth of the total ( $\gamma$ , n) cross section there. The cross section integrated to 43 MeV is only  $11.8 \text{ mb} \cdot \text{MeV}$ , and as a result the isospin assignments of (1979WO04) are unaffected by neglect of this channel. A recent extensive study of isospin effects in the photodisintegration of light nuclei (1993MC02) used a collection of data on ( $\gamma$ , p), ( $\gamma$ , n), ( $\gamma$ , 2n) and ( $\gamma$ ,  $n_0$ ) cross sections and separated the  $T_>$  and  $T_<$  isospin components of the GDR in several light nuclei including  $^{18}\text{O}$ . The relative strengths were extracted. See also the atlas of photoneutron cross sections with monoenergetic photons (1988DI02), and see (1988BE1T, 1989NO1C). Structures in the ( $\gamma$ ,  $\alpha_0$ ) cross section are reported at  $E_x = 18.2, 20.9, 22.1$ , and  $24.2$  MeV (1982BA03;  $E_{\text{brems.}}$ ). The decay of the GDR to  $^{14}\text{C}$ ,  $^{15}\text{N}$ ,  $^{16}\text{O}$ ,  $^{17}\text{N}$  and  $^{17}\text{O}$  states has been studied: see (1983AJ01). Less

<sup>a</sup> (1982OL01).

<sup>b</sup>  $\gamma$ -ray energies have not been corrected for nuclear recoil.

<sup>c</sup>  $\gamma$ -ray intensities are normalized such that the flux into the ground state is 100.

To obtain  $\gamma$ -ray intensities per 100 parent decays multiply by 0.735 ± 0.021 (see reaction 22 under  $^{18}\text{O}$  for discussion of this normalization).

than 20% of the decay of states with  $14.5 < E_x < 20$  MeV goes via the  $n_0$  channel ([1987JU07](#)). See ([1978AJ03](#), [1987AJ02](#)) for the earlier work.

#### 24. $^{18}\text{O}(\gamma, \gamma)^{18}\text{O}$

For  $^{18}\text{O}^*(6.20)$   $\Gamma_{\gamma_0} = 0.18 \pm 0.03$  eV, assuming  $\Gamma_{\gamma_0}/\Gamma = 0.88$ ;  $E_x = 6202.7 \pm 0.8$  keV: see ([1978AJ03](#)).

#### 25. $^{18}\text{O}(e, e')^{18}\text{O}$

The  $^{18}\text{O}$  charge radius,  $\langle r^2 \rangle^{1/2} = 2.784 \pm 0.020$  fm, based on studies of the elastic charge form factors for  $E_e = 70$  to  $370$  MeV, the resulting determinations of the difference in the  $^{18}\text{O}$  and  $^{16}\text{O}$  radii, and the rms radius of  $^{16}\text{O}$ : see ([1983AJ01](#)).

Inelastic scattering has been reported to many states of  $^{18}\text{O}$ : see ([1983AJ01](#), [1987AJ02](#)) and Table 18.21 here which also includes the recent work reported in ([1995SE02](#)). See also the comment ([1987MI25](#)) and reply ([1987MA40](#)) on the work reported in ([1986MA48](#)). Recent measurements are reported for  $4^-$  and  $6^-$  states at  $E_e = 140$ – $275$  MeV ([1990SEZZ](#)), and for  $1^-$ ,  $3^-$ ,  $5^-$  states ([1991MA14](#)). Form factor measurements for the  $2^+$  level at  $E_x = 8.21$  MeV and the  $(2^+)$  level at  $E_x = 9.3$  MeV at momentum transfer  $0.9 < q < 2.1$  fm $^{-1}$  ([1990MA06](#)) and for the  $1^-$ ,  $3^-$  and  $5^-$  levels at  $0.6 < q < 2.7$  fm $^{-1}$  ([1991MA14](#)) are reported.

Several theoretical studies of inelastic electron scattering to states of  $^{18}\text{O}$  have been carried out. A microscopic calculation for scattering to  $2^+$  states is reported in ([1988HAZZ](#)) and to  $0^+$  and  $2^+$  states in ([1988KU17](#)). See also the calculations of transition charge densities described in ([1988GU03](#), [1988GU12](#), [1992GU11](#)) and see ([1987GU1D](#), [1988GU1B](#), [1989AJ1A](#)).

#### 26. (a) $^{18}\text{O}(\pi^\pm, \pi^{\pm'})^{18}\text{O}$

$$(b) \ ^{18}\text{O}(\pi^\pm, \pi^\pm p)^{17}\text{N} \quad Q_m = -15.942$$

$$(c) \ ^{18}\text{O}(\pi^-, \pi^- n)^{17}\text{O} \quad Q_m = -8.044$$

Angular distributions for the scattering to  $^{18}\text{O}^*(0, 1.98, 5.10)$  have been reported at  $E_{\pi^\pm} = 29.2$  to  $230$  MeV [see ([1983AJ01](#))] and at  $50$  MeV ([1984TA1A](#);  $^{18}\text{O}^*(0, 1.98)$ ) at  $140$ ,  $180$ , and  $220$  MeV ([1984SE1A](#);  $^{18}\text{O}^*(1.98)$ ), at  $164$  MeV ([1987CH14](#);  $^{18}\text{O}^*(0, 1.98, 4.46, 5.10)$ ) and ([1988SE04](#);  $^{18}\text{O}^*(1.98, 3.92, 5.26$  MeV)). See also ([1989GR1M](#), [1990WI1K](#)). Measurements and analysis work reported in ([1983AJ01](#)) determine  $\langle r_n^2 \rangle^{1/2} = 2.81 \pm 0.03$  fm,  $\langle r_n^2 \rangle^{1/2} - \langle r_p^2 \rangle^{1/2} = 0.03 \pm 0.03$  fm. For a discussion of proton matter distribution in  $^{18}\text{O}$  see ([1985BA27](#)). Total reaction cross sections at  $E_\pi = 50$  MeV

have been determined by (1987ME12). At  $E = 165$  MeV, the cross section for reaction (c) is larger for  $^{18}\text{O}$  than for  $^{16}\text{O}$  while reaction (b) has a lower cross section (1982PI06). For the ( $\pi^+$ , 2p), ( $\pi^+$ , pn) and ( $\pi^-$ , pn) reactions at  $E_\pi = 165$  MeV see (1984AL20, 1986AL22).

Results of Glauber model calculations of pion scattering from  $^{18}\text{O}$  at energies above the  $\Delta_{33}$  resonance are presented in (1991OS01). A microscopic study of inelastic scattering to the  $2^+$  states in  $^{18}\text{O}$  is reported in (1988HAZZ). See also the review of pion-nucleus physics in (1991MO13).

Angular distributions have been measured for  $E_n = 2.9$  to  $24$  MeV [see ([1972AJ02](#), [1983AJ01](#))] and at  $E_n = 5.0$  to  $7.5$  MeV ([1986KO10](#);  $n_0, n_1$ ).

## 28. $^{18}\text{O}(\text{p}, \text{p}')^{18}\text{O}$

Angular distributions have been measured for  $E_p = 0.84$  to  $135$  MeV [see ([1978AJ03](#), [1983AJ01](#))], at  $E_p = 135$  MeV ([1986KE05](#);  $p_1$ ) and at  $E_p = 800$  MeV ([1982GL08](#);  $\text{p to } ^{18}\text{O}^*(0, 1.98, 7.12)$ .) At  $E_p = 24.5$  MeV ([1974ES02](#)) have studied the angular distributions of the proton groups to  $^{18}\text{O}^*(1.98, 3.55, 3.63, 3.92, 4.46, 5.10, 5.26, 5.53, 7.12)$ : a modified DWBA analysis leads to  $J^\pi = 2^+, 4^+, 0^+, 2^+, 1^-, 3^-, 2^+, 2^-$  and  $4^+$  for these states. A coupled-channels calculation suggests  $\beta_2 = 0.37 \pm 0.03, 0.56 \pm 0.06$  and  $0.18 \pm 0.04$  for  $^{18}\text{O}^*(1.98, 5.10, 7.12)$ . Such calculations also support evidence for a rotational band involving  $^{18}\text{O}^*(0, 1.98, 7.12)$ . The  $3^-$  state at  $5.10$  MeV is strongly excited and collective in nature:  $B(E3) = 1120 e^2 \cdot \text{fm}^6$ . For  $^{18}\text{O}^*(1.98, 3.92, 5.26)$ ,  $B(E2) = 45, 8.3$  and  $24 e^2 \cdot \text{fm}^4$  ([1974ES02](#)). The  $800$  MeV data indicates that  $^{18}\text{O}^*(7.12)$  can be described only if a large hexadecapole deformation is assumed ([1982GL08](#)). At  $E_p = 201$  MeV,  $\sigma(\theta)$  at forward angles has been measured to  $^{18}\text{O}^*(8.21, 8.82, 16.40)$ : it is proposed that  $^{18}\text{O}^*(8.82)$  has  $J^\pi = 1^+$  and that additional  $1^+$  strength is located in a group centered at  $E_x \approx 10.1$  MeV as well as in the region  $E_x = 12.4$  to  $15$  MeV. The  $1^+; T = 2$  state  $^{18}\text{O}^*(18.87)$ , reported in  $(\text{e}, \text{e}')$ , is not observed ([1987DJ01](#)). See also ([1988CR1B](#)).

$^{18}\text{O}^*(1.98)$  has  $|g| = 0.287 \pm 0.015$  [ $\tau_m = 2.99 \pm 0.12$  ps].  $^{18}\text{O}^*(3.55)$  has  $|g| = 0.62 \pm 0.10$  suggesting a mainly  $(d_{5/2})^2$  configuration for this state: see ([1983AJ01](#)). See also  $^{19}\text{F}$  and ([1987AJ02](#)).

A Dirac optical model analysis of  $^{18}\text{O}(\text{p}, \text{p})$  cross section and analyzing power at  $800$  MeV is described in ([1990PH02](#)). A coupled-channels analysis was presented in ([1988DE31](#)). The intrinsic radial sensitivity of nucleon inelastic scattering was studied by ([1988KE01](#)) and a comparison of electromagnetic and hadronic probes of nuclear structures is described in ([1986KE1C](#)).

## 29. $^{18}\text{O}(\bar{\text{p}}, \bar{\text{p}}')^{18}\text{O}$

Angular distributions are reported with  $178.4$  MeV antiprotons to  $^{18}\text{O}^*(0, 1.98)$  ([1986BR04](#), [1986LE13](#)). For atomic effects see ([1986KO22](#)). See also ([1987AJ02](#)).

Differential cross sections for elastic and inelastic scattering of  $180$  MeV antiprotons by  $^{18}\text{O}$  were calculated in the eikonal and Glauber approaches by ([1992TA08](#)).

## 30. $^{18}\text{O}(\text{d}, \text{d})^{18}\text{O}$

Angular distributions have been reported at  $E_d = 7.0$  to  $15.0$  MeV: see ([1972AJ02](#), [1983AJ01](#)). See also  $^{20}\text{F}$ .

See (1972AJ02).

The elastic scattering has been studied at  $E(^3\text{He}) = 11.0$  to  $41$  MeV [see (1972AJ02, 1983AJ01)] and at  $14$  MeV (1982AB04), at  $25$  MeV (1982VE13) [the matter radius,  $\langle r^2 \rangle_m^{1/2} = 2.59 \pm 0.12$  fm] and at  $33$  MeV (1983LE03; also  $A_\gamma$ ; and also to  $^{18}\text{O}^*(1.98)$ ). A strong-absorption model analysis of angular distributions at  $2.5$  and  $41$  MeV is described in (1987RA36). See also (1985HA11, 1987CO07).

Recent elastic scattering cross sections at  $E_\alpha = 44.8$  MeV were reported by (1992AR18). Angular distributions of many  $\alpha$ -groups have been measured in the range  $E_\alpha = 21$  to  $40.5$  MeV [see (1978AJ03)], at  $23.5$  MeV (1984SA28; to  $^{18}\text{O}^*(1.98, 3.56 + 3.63, 3.92, 4.45, 5.1-5.53)$ ) and at  $54.1$  MeV (1987AB03; g.s.). The transitions to  $^{18}\text{O}^*(4.46, 5.10)$  are  $L = 1$  and  $3$ , respectively, fixing  $J^\pi = 1^-$  and  $3^-$  for these states. Measurements of  $\alpha$ -groups near  $180^\circ$  for  $E_\alpha = 20.0$  to  $23.4$  MeV confirm assignments of natural parity for  $^{18}\text{O}^*(1.98, 3.55, 3.63, 3.92, 4.46, 5.10, 5.26, 5.34, 6.20, 6.40, 7.12, 7.62, 7.86, 8.22, 8.29, 8.82, 8.96, 9.03, 9.10, 9.36, 9.41, 9.67, 9.72 \pm 0.03, 9.88, 10.12, 10.30, 10.40, 11.62, 11.69)$ . [See, however, Table 18.9.] Levels at  $E_x = 5.38, 8.48$  and  $8.64$  MeV were not observed, and those at  $5.53, 6.35$  and  $6.88$  MeV were populated weakly indicating unnatural parity;  $J^\pi = 3^+$  and  $2^-$  respectively for  $^{18}\text{O}^*(5.38, 5.53)$ .

Alpha-gamma correlation measurements involving  $^{18}\text{O}$  states below  $E_x = 6.4$  MeV [see Table 18.10] lead to  $J^\pi = 1^-$  and  $3^-$  for  $^{18}\text{O}^*(6.20, 6.40)$ . Other  $J^\pi$  values agree with previous assignments. The transitions  $3.92 \rightarrow 1.98$  and  $5.26 \rightarrow 1.98$  are almost pure M1. For  $\tau_m$  measurements, see Table 18.4 in (1978AJ03). For references see (1983AJ01, 1987AJ02). A microscopic investigation of the  $\alpha + ^{18}\text{O}$  system in a three-cluster model is discussed in (1988DE37).

See (1972AJ02, 1983AJ01).

A recent search for a bound system of  $\pi^-$  and neutrons in the fragmentation region of  $^{18}\text{O} + ^9\text{Be}$  collisions at  $100 \text{ A} \cdot \text{MeV}$  is reported in ([1993SU08](#)). Upper limits were obtained.

See also ([1972AJ02](#), [1987AJ02](#)).

36. (a)  $^{18}\text{O}(^{10}\text{B}, ^{10}\text{B}')^{18}\text{O}$   
 (b)  $^{18}\text{O}(^{11}\text{B}, ^{11}\text{B}')^{18}\text{O}$

An elastic angular distribution has been reported at  $E(^{11}\text{B}) = 115 \text{ MeV}$ : see ([1983AJ01](#)). For reaction (a) see ([1974AJ01](#)).

A recent measurement of  $^{18}\text{O}$  on  $^{10,11}\text{B}$  targets at  $E_{\text{lab}} \approx 55 \text{ MeV}$  is described in ([1993AN08](#)) and evidence for fusion-fission rather than orbiting is reported. See also ([1990SZ1C](#)).

37. (a)  $^{18}\text{O}(^{12}\text{C}, ^{12}\text{C}')^{18}\text{O}$   
 (b)  $^{18}\text{O}(^{13}\text{C}, ^{13}\text{C}')^{18}\text{O}$   
 (c)  $^{18}\text{O}(^{14}\text{C}, ^{14}\text{C}')^{18}\text{O}$   
 (d)  $^{18}\text{O}(^{12}\text{C}, \alpha^{12}\text{C}')^{14}\text{C}$        $Q_m = -6.227$

Elastic angular distributions have been studied at  $E(^{18}\text{O}) = 32.3$  to  $57.5 \text{ MeV}$  for reaction (a) [as well as at  $E(^{18}\text{O}) = 70, 100, \text{ and } 140 \text{ MeV}$  ([1982HE07](#))] and at  $E(^{18}\text{O}) = 31 \text{ MeV}$  for reaction (b). Yields and fusion cross sections are reported by ([1982BA49](#), [1982HE07](#), [1985BE40](#), [1985CA01](#), [1986GA13](#)). For reaction (c) see ([1986STZY](#)). See also ([1983AJ01](#), [1987AJ02](#)).

Angular correlations (reaction (d)) have been studied at  $E(^{18}\text{O}) = 82 \text{ MeV}$ .  $^{18}\text{O}^*(7.10, 7.62, 7.86, 8.04, 8.22, 10.30, 11.59, 12.55)$  are observed: the first seven of these have  $J^\pi = 4^+, 1^-, 5^-, 1^-, 2^+, 4^+, 5^-$  ([1984BH01](#), [1984RA07](#)). In addition  $^{18}\text{O}^*(9.33, 9.65)$  are also populated [ $\Gamma \approx 0.3 \text{ MeV}$ ]: a possible interpretation of the data is that these two are  $3^-$  states and that there is in addition a very wide ( $> 1 \text{ MeV}$ )  $2^+$  state at  $\approx 9.5 \text{ MeV}$  ([1984RA17](#)). See also ([1987AJ02](#)).

Giant dipole decays in nuclei excited by  $^{18}\text{O} + ^{12}\text{C}$  collisions were discussed in ([1989BEZC](#), [1990SN1A](#)). Competition between p2n, dn and t emissions in the  $^{12}\text{C} + ^{18}\text{O}$  reaction was studied in an experiment reported in ([1990XE01](#)).

Predictions of possible resonant behavior in medium-mass colliding systems are discussed in ([1989CI1C](#)). Molecular single particle effects for  $^{12}\text{C} + ^{18}\text{O}$  are explored in calculations described in ([1987MO27](#)).

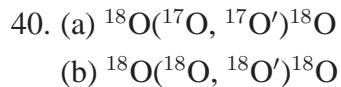

38.  $^{18}\text{O}(^{15}\text{N}, ^{15}\text{N}')^{18}\text{O}$

See ([1983DU13](#)).

Angular distributions have been measured at many energies for  $E(^{16}\text{O}) = 24$  to 54.5 MeV and  $E(^{18}\text{O}) = 25$  to 52 MeV, involving besides  $^{18}\text{O}_{\text{g.s.}}$ ,  $^{18}\text{O}^*(1.98, 3.55 + 3.63, 3.92, 4.46, 5.10, 7.12)$ . At  $E(^{18}\text{O}) = 126$  MeV  $^{18}\text{O}^*(9.0)$  is relatively strongly populated. See ([1983AJ01](#)). For yields and fusion cross sections, including the effect of  $^{18}\text{O}^*(1.98)$ , see ([1985TH03](#), [1985WU03](#), [1986GA13](#), [1986TH01](#)). See also ([1987AJ02](#)). Competition between p2n, dn and t emissions in  $^{18}\text{O} + ^{16}\text{O}$  reactions was studied in an experiment reported in ([1990XE01](#)).

A unified description of sub-barrier interactions of oxygen isotopes is discussed in ([1987PO11](#)); see the coupled-channels calculations reported in ([1992LI1K](#)). See also the review of sub-barrier fusion in ([1988BE1W](#)). A semi-classical analysis of two particle transfer in  $^{16}\text{O} + ^{18}\text{O}$  reactions is discussed in ([1987MA22](#)).

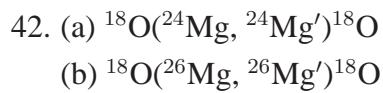

Angular distributions involving  $^{18}\text{O}^*(0, 1.98)$  are reported at  $E(^{17}\text{O}) = 36$  MeV. Angular distributions [reaction (b)] have been studied at  $E(^{18}\text{O}) = 20$  to 52 MeV.  $^{18}\text{O}^*(3.55 + 3.63, 4.46, 5.10, 7.12)$  are also populated; see ([1978AJ03](#), [1983AJ01](#)). See also ([1987AJ02](#)) and see ([1990XE01](#)) reporting on p2n, dn and t emissions in  $^{18}\text{O} + ^{18}\text{O}$  reactions.

The effect of high spin states on fusion in  $^{18}\text{O} + ^{18}\text{O}$  systems has been studied in the framework of a statistical theory ([1987RA28](#)).

The elastic scattering has been studied at  $E(^{19}\text{F}) = 27, 30$ , and 33 MeV: see ([1983AJ01](#)). See also ([1987AJ02](#)). An experiment reported in ([1990XE01](#)) studied p2n, dn and t emission in  $^{18}\text{O} + ^{19}\text{F}$  reactions.

Angular distributions are reported for reaction (a) at  $E(^{18}\text{O}) = 29$  and 35 MeV to  $^{18}\text{O}^*(0, 1.98)$ . See ([1987AJ02](#)).

The elastic angular distribution has been studied at  $E(^{18}\text{O}) = 100$  MeV ([1981ME13](#)). See also ([1983AJ01](#), [1987AJ02](#)).

Elastic angular distributions are reported at  $E(^{18}\text{O}) = 36$  to  $56$  MeV [see ([1983AJ01](#))] and at  $351.7$  MeV ([1984BUZX](#), [1988BU15](#); also to  $^{18}\text{O}^*(1.98)$ ). See also ([1987AJ02](#)).

Ambiguities in optical-model potentials for describing  $^{18}\text{O} + ^{28}\text{Si}$  and other heavy-ion reactions are discussed in ([1987HO18](#)). See also ([1989NA1M](#)).

Angular distributions have been measured at  $E(^{18}\text{O}) = 62.1$  MeV [reaction (a)] for the transitions to  $^{18}\text{O}^*(0, 1.98, 5.10)$  ([1982RE14](#)). For a fusion study [reaction (b)] see ([1984DE38](#)). See also ([1987AJ02](#), [1987SC34](#)).

$$Q_m = 1.655$$

See  $^{18}\text{F}$ .

$$Q_m = -7.994$$

([1985KE03](#)) have measured the yields of proton groups to  $^{18}\text{O}^*(0, 1.98)$  [and to unresolved states] for  $E_{\text{bs}}$  in the GDR range. See also ([1978AJ03](#)) and  $^{19}\text{F}$ .

$$Q_m = -5.770$$

Angular distributions have been measured at  $E_n = 14$  to  $14.4$  MeV: see ([1972AJ02](#)). See also ([1978AJ03](#)) and  $^{20}\text{F}$ . Nuclear model calculations for  $E_n = 2$ – $20$  MeV are described in ([1992ZH15](#)).

Table 18.22:  $^{18}\text{O}$  states from  $^{19}\text{F}(\text{t}, \alpha\gamma)$ <sup>a</sup>

$E_x$ (keV)	$J^\pi$	$E_x$ (keV)	$J^\pi$
1982.16 ± 0.20		5530.5 ± 0.6	1, 2
3555.07 ± 0.45		6196.3 ± 1.2	1
3634.50 ± 0.40		6351.3 ± 0.6	1, 2
3920.6 ± 0.4		6404.4 ± 1.2	
4456.1 ± 0.5		6881.6 ± 1.2	0, (1)
5098.5 ± 1.2		7116.9 ± 1.2	
5260.4 ± 1.2		7750	1, 2, 3, 4
5336.4 ± 0.6		7980	1, 2, 3, 4, 5
5377.8 ± 1.2		b	

<sup>a</sup> (1973OL02): See Table 18.10 for branching ratios and Table 18.9 for  $\tau_m$ . See also Table 18.10 in (1983AJ01).

<sup>b</sup> Alpha groups are also reported to  $^{18}\text{O}$  states with  $E_x = 7.60, 7.75, 7.84, 7.96, 8.02, 8.11, 8.19, 8.26, 8.39, 8.48, 8.64$  MeV ( $\pm 20$  keV) (1962HI06).

Experimental and theoretical studies of knockout reactions are reviewed in (1987VD1A).

Many states of  $^{18}\text{O}$  ( $E_x < 14.6$  MeV) have been populated in this reaction: see Table 18.8 in (1978AJ03). [Comment: Note, however, density of states.] Analyzing powers for the ground-state transition are reported at  $E_d = 12.4$  MeV (1983EN02). See also (1983KI13).

See Table 18.22.

At  $E_d = 80$  MeV angular distributions have been measured for the  ${}^6\text{Li}$  groups to the ground state of  ${}^{18}\text{O}$  and to excited states at 1.98, 3.57, 5.10, 6.30, 7.8, 9.4 [ $\pm 0.04$ ] MeV ([1984OE02](#)) [see also for  $S_{\text{rel}}$ ]. For the earlier work see ([1983AJ01](#)).

**<sup>18</sup>F**  
(Figs. 3 and 5)

GENERAL: See Table 18.23.

$$\mu_{1.12} = +2.86 \pm 0.03 \text{ nm [see (1983AJ01)]}$$

$$Q_{1.12} = 0.13 \pm 0.03 \text{ b [see (1983AJ01)].}$$

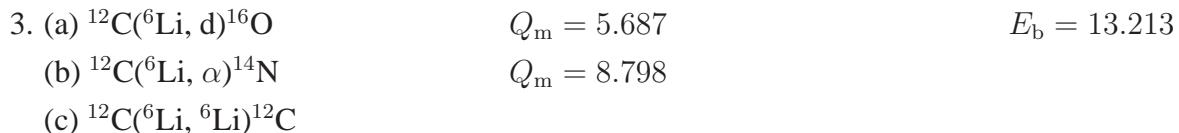

The positron decay is entirely to the ground state of  $^{18}\text{O}$  [ $J^\pi = 0^+$ ,  $T = 1$ ]; the half-life is  $109.77 \pm 0.05$  min [see Table 18.11 in (1972AJ02)];  $\log ft = 3.554$ . The fact that the  $\beta^+$  transition to  $^{18}\text{O}_{\text{g.s.}}$  is allowed fixes  $J^\pi = 1^+$  for  $^{18}\text{F}_{\text{g.s.}}$ .

The ratio  $\epsilon_K/\beta^+ = 0.030 \pm 0.002$ : see (1978AJ03, 1987AJ02). See also (1989SA1P, 1989KA1S).

The influence of meson exchange currents of the second kind is discussed in (1988SA12) and in (1989SA1H) which also considers the effects of neutrino mass. Charged-current ( $\nu_e, e^-$ ) reactions on  $^{18}\text{O}$  and the predicted effects on a proposed neutrino elastic scattering measurement of the Weinberg angle is discussed in (1988HA22).

See (1986CU02) for production cross sections of 0.94 MeV  $\gamma$ -rays.

Cross sections for these and other charged particle channels have been measured for  $E(^6\text{Li}) = 1.9$  to 36 MeV [see (1978AJ03, 1983AJ01)]. More recently, measurements of cross sections at  $E(^6\text{Li}) = 210$  MeV are reported in (1988NA02). Vector analyzing power measurements have been made at  $E(^6\text{Li}) = 150$  MeV (1987TA21, 1988TA08) and at  $E(^6\text{Li}) = 30$  MeV (1994RE01) for elastic scattering and at  $E(^6\text{Li}) = 30$  MeV (1988VAZY, 1989VA04) for inelastic scattering to  $^{12}\text{C}^*(4.43)$ . Neutron yields from  $^6\text{Li} + ^{12}\text{C}$  at  $E(^6\text{Li}) = 40$  MeV have been measured by (1987SC11).

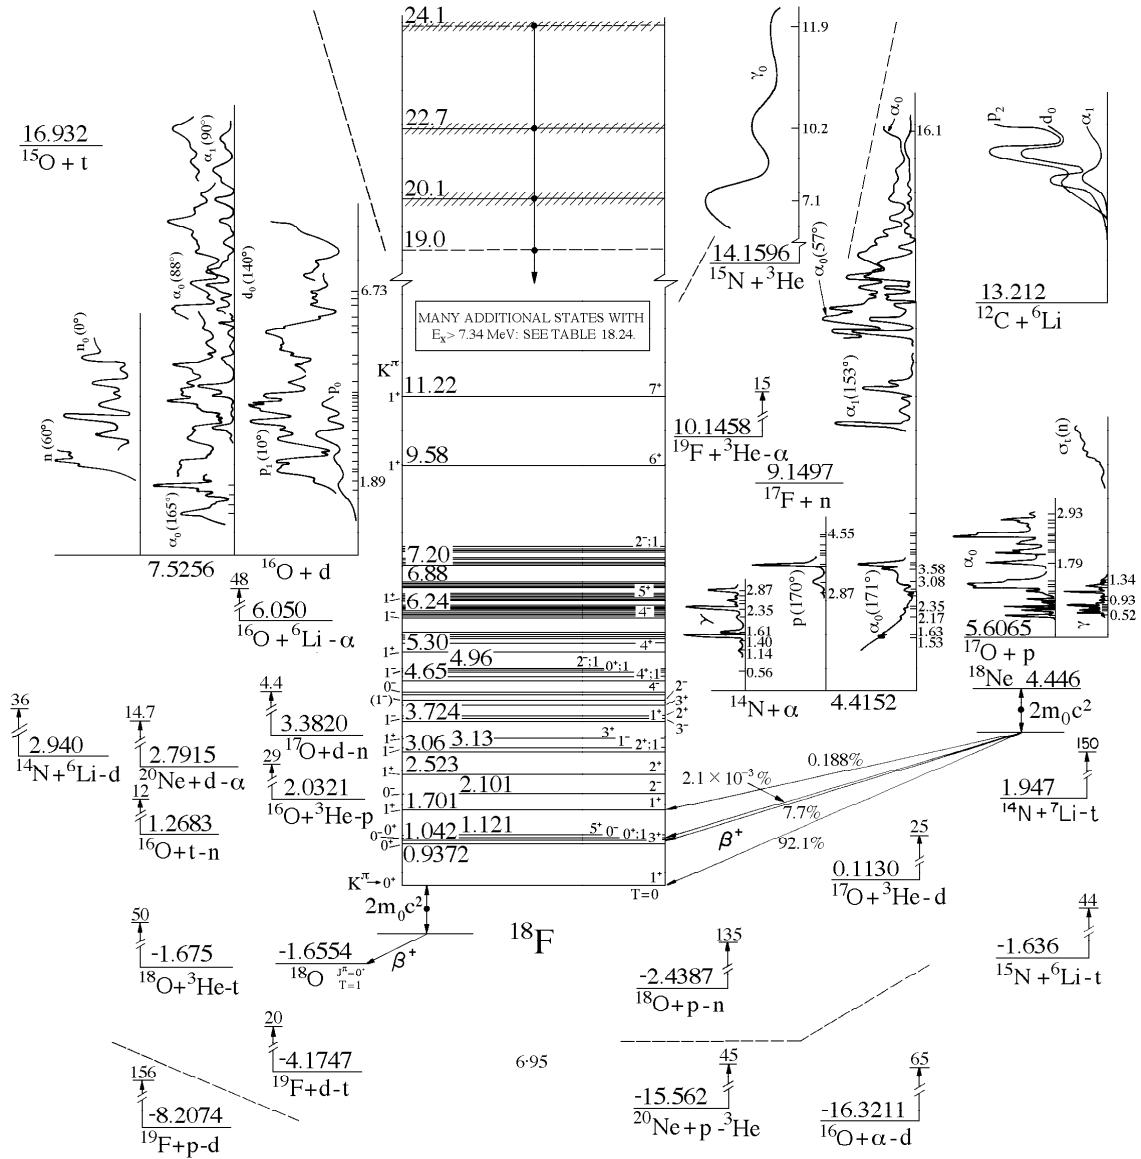

Fig. 3: Energy levels of  $^{18}\text{F}$ . For notation see Fig. 2.

(A) denotes that only an abstract is available for this reference.

The cross section for the isospin-forbidden  $\alpha_1$  group [to  $^{14}\text{N}^*(2.31)$ ,  $0^+$ ,  $T = 1$ ] is 1 to 2% of the cross section of the allowed  $\alpha_0$  and  $\alpha_2$  groups for  $E(^6\text{Li}) = 3.2$  to 6 MeV while for 9 to 14 MeV it varies from 0.4 to 1.8%. At 20 MeV, the  $\alpha_1$  yield is 0.02% of the allowed yield. Structures are reported at  $E(^6\text{Li}) = 11.0$  and 13.0 MeV in the  $\alpha_0$  yield, at 11.5 and 13.0 MeV in the  $\alpha_1$  yield and at  $\approx 11.7$  and 12.8 MeV in the  $\alpha_2$  yield. A resonance is also reported in the  $\alpha_1$  yield at  $E(^6\text{Li}) = 4.2$  MeV:  $E_x = 15.99 \pm 0.02$  MeV,  $\Gamma_{\text{c.m.}} = 290 \pm 30$  keV,  $J^\pi = 2^+$  (one-level BW fit). It is suggested that this resonance is due to  $2^+$  states with  $T = 0$  and 1 which are unresolved. Cross sections for populating  $^{16}\text{O}^*(8.87, 10.36, 11.08, 11.10)$  are reported by (1981GL02).

The excitation functions for the  $^6\text{Li}$  ions to  $^{12}\text{C}^*(0, 4.43)$  show a single isolated structure at  $E(^6\text{Li}) = 22.8$  MeV, in the range 20–36 MeV, with  $\Gamma \approx 0.8$  MeV. It is unlikely to be due to an isolated state in  $^{18}\text{F}$ . Analyzing power measurements are reported for many deuteron and  $\alpha$  groups and for elastically scattered  $^6\text{Li}$  ions at  $E(^6\text{Li}) = 20$  MeV. VAP measurements for elastic

scattering are also reported at  $E_d = 9.0$  and  $19.2$  MeV ([1983RU09](#)) and at  $150$  MeV ([1986KA1C](#), [1986TA1B](#)).

For fusion studies see ([1982DE30](#), [1987PA12](#)). For references to earlier work and for additional comments see ([1978AJ03](#), [1983AJ01](#), [1987AJ02](#)),  $^{12}\text{C}$  in ([1985AJ01](#)),  $^{14}\text{N}$  in ([1986AJ01](#)), and  $^{16}\text{O}$  in ([1986AJ04](#), [1993TI07](#)).

<sup>a</sup> See also Table 18.25 for radiative transitions and 18.26 for  $\tau_m$ .

<sup>b</sup> Uncertainty estimated by evaluators.

<sup>c</sup> For other states with  $E_x < 9.6$  MeV see footnote <sup>e</sup> in Table 18.17 of (1978AJ03) and Table 18.27 here. For other states with  $10.0 < E_x < 19.6$  MeV see Table 18.27 here, and Tables 18.14 and 18.16 in (1978AJ03). These two tables in (1978AJ03) display the states deduced from the yields of the isospin-forbidden  $\alpha_1$  groups in  $^{14}\text{N} + \alpha$  and  $^{16}\text{O} + \text{d}$ , respectively. (1976CH24) reports 151 isospin-mixed natural-parity states with  $10.4 < E_x < 17.5$  MeV [ $^{14}\text{N}(\alpha, \alpha_1)$ ] and (1973JO13) reports 138 such states with  $9.2 < E_x < 19.4$  MeV [ $^{16}\text{O}(\text{d}, \alpha_1)$ ] of which 16 have  $E_x > 17.5$  MeV. In the region  $10.4 < E_x < 20.8$  MeV some 167 states with mixed isospin and natural parity have been reported. See also reaction 29.

<sup>d</sup> (1989BO01).

Angular distributions are reported at  $E({}^9\text{Be}) = 12$  to 27 MeV to  ${}^{18}\text{F}_{\text{g.s.}}$  and to the unresolved states at 1 MeV: see (1983AJ01). For excitation functions see (1982HU06, 1983JA09).

For  ${}^{18}\text{F}^*(4.85)$  [5 $^-$ ;  $T = 0$ ]  $\tau_m = 5.2 \pm 0.9$  ps. The E1 strength is  $(3.4 \pm 0.6) \times 10^{-6}$  W.u. for the transition to  ${}^{18}\text{F}^*(1.12)$  [5 $^+$ ;  $T = 0$ ] and the E2 strength is  $14.8 \pm 2.6$  W.u. for that to  ${}^{18}\text{F}^*(3.79)$  [3 $^-$ ; 0]. The latter strength, which is that of a highly collective transition, corresponds to a quadrupole moment  $Q_0 = 395 \pm 35$  mb and suggests that  ${}^{18}\text{F}^*(4.85)$  is the 5 $^-$  state of a (strongly decoupled)  $K^\pi = 1^-$  band (1982KO24). See also Tables 18.14 and 18.15.

The non-resonant  $S$ -factor for this reaction is  $S \approx 0.7$  MeV · b: see (1978AJ03). A number of resonances have been observed for  $E_\alpha < 3$  MeV: see Table 18.27. Studies of these, principally

by the Toronto and Queen's groups [see references in (1978AJ03, 1983AJ01)] in conjunction with work on  $^{14}\text{N}(\alpha, \alpha)$ ,  $^{16}\text{O}(^3\text{He}, \text{p})$ ,  $^{17}\text{O}(\text{p}, \gamma)$  and  $^{17}\text{O}(\text{p}, \alpha)$  [see Tables 18.29, 18.30, 18.31] have led to the determination of branching ratios, mixing ratios and widths (Table 18.25), lifetimes (Table 18.26) and the  $E_x$ ,  $J^\pi$  and  $K^\pi$  assignments for  $^{18}\text{F}$  states with  $E_x < 6.9$  MeV. The reader is referred to the series of papers by the Toronto group for the most complete and definitive arguments on the parameters of the low-lying states of  $^{18}\text{F}$ .

A recent measurement reported in (1989BO01) determines a value  $E_x = 5672.57 \pm 0.32$  keV for the first  $^{18}\text{F}$  level above the proton threshold. This level is important for calculating the rate of  $^{17}\text{O}$  destruction during hydrogen burning in stars.

No evidence is seen for the excitation of the (forbidden) state at  $E_x = 4.753$  MeV [ $J^\pi = 0^+, T = 1$ ] (1981LE1A, 1983LE08). See also (1987AJ02), and see the tables of reaction rates (1988CA26) and the reviews of (1989KA24, 1989WH1B, 1989TH1C).

$$7. \ ^{14}\text{N}(\alpha, \text{p})^{17}\text{O} \quad Q_m = -1.192 \quad E_b = 4.415$$

Table 18.27: Resonances in  $^{14}\text{N} + \alpha$  below  $E_\alpha = 5 \text{ MeV}$ <sup>a</sup> (continued)

$E_\alpha$ (MeV $\pm$ keV)	Particles out	$\Gamma_{\text{c.m.}}$ (keV)	$(2J+1)\Gamma_\gamma\Gamma_\alpha/\Gamma$ (eV)	$J^\pi; T$	$E_x$ (MeV)
4.28	$p_0, \alpha_0$	120			7.74
4.50	$p_0, \alpha_0$	30		$(2^-)$	7.92
4.55	$p_0, \alpha_0$	70		$(1^+)$	7.95

<sup>a</sup> References are displayed in Tables 18.13 of ([1972AJ02](#), [1978AJ03](#)). Higher resonances observed in  $^{14}\text{N}(\alpha, \alpha_1)$  are listed in Table 18.14 of ([1978AJ03](#)).

<sup>b</sup>  $\omega\gamma = 0.45 \pm 0.02$  ([1982BE29](#)).

<sup>c</sup>  $\leq 0.07$  for  $^{18}\text{F}^*(6.11, 6.16 \text{ MeV})$  ([1973RO03](#)).

<sup>d</sup>  $\leq 0.03$  for  $^{18}\text{F}^*(6.28 \text{ MeV})$  ([1973RO03](#)).

<sup>e</sup>  $\Gamma_\alpha = 42.8 \pm 1.6 \text{ eV}$ ,  $\Gamma_\gamma = 0.485 \pm 0.046 \text{ eV}$ ,  $l_\alpha = 0$  ([1980MA26](#)). See also Table 18.30.

<sup>f</sup>  $\Gamma_\alpha = 32.0 \pm 2.1 \text{ eV}$ ,  $\Gamma_\gamma = 0.891 \pm 0.074 \text{ eV}$ ,  $l_\alpha = 1$ .  $\Delta E_x$  for  $^{18}\text{F}^*(5.603, 5.605 \text{ MeV})$  is  $1.84 \pm 0.04 \text{ keV}$  ([1980MA26](#)). See also Table 18.30.

<sup>g</sup>  $\Gamma_\alpha = 130 \pm 5 \text{ eV}$ ,  $\Gamma_\gamma = 1.4 \pm 0.3 \text{ eV}$ ,  $l_\alpha = 1$  ([1980MA26](#)). More recently, an accurate energy measurement for this level by ([1989BO01](#)) gave  $E_x = 5672.57 \pm 0.32 \text{ keV}$ .

<sup>h</sup> This resonance corresponds to two states at  $E_x = 6240$  and  $6242 \text{ keV}$ . The lower member of the doublet (both of which have  $J^\pi = 3^-$  and mixed isospin) has  $\Gamma_\alpha = 133 \pm 4 \text{ eV}$ ,  $\Gamma_\gamma = 0.80 \pm 0.11 \text{ eV}$ ; the higher has  $\Gamma_\alpha = 137 \pm 0.4 \text{ eV}$ ,  $\Gamma_\gamma = 0.73 \pm 0.11 \text{ eV}$  ([1979KI12](#)).

<sup>i</sup>  $\Gamma_\alpha = 580 \pm 12 \text{ eV}$ ,  $\Gamma_p = 25^{+35}_{-25} \text{ eV}$  ([1979KI12](#)).

Observed anomalies in the elastic scattering [reaction (a)] are exhibited in Table 18.27. Resonances in the  $\alpha_1$  isospin-forbidden yield are displayed in Table 18.14 of ([1978AJ03](#)). In the  $\alpha_1$  study, carried out for  $E_\alpha = 7.6\text{--}16.9 \text{ MeV}$ , a partial-wave analysis involving a method of removing ambiguities and parametrizing  $S$ -matrix elements gives the level parameters of 151 isospin mixed, natural-parity states in  $^{18}\text{F}$  with  $10.4 < E_x < 17.5 \text{ MeV}$ . Many of these states have also been reported in the  $^{16}\text{O}(d, \alpha_1)$  reaction [Table 18.16 of ([1978AJ03](#))]. The agreement is best for low-lying  $2^+$  or  $4^+$  states, and is quite good for  $3^-$  and  $5^-$  states, while for high- $J$  states the greater centrifugal barrier for  $^{16}\text{O} + d$  at the same  $E_x$  leads to a relative suppression of high- $J$  states in the  $^{16}\text{O} + d$  work. A study of the energy dependence of averaged intensities of the partial waves shows some indication that the lower partial waves conserve isospin as  $E_x$  increases.

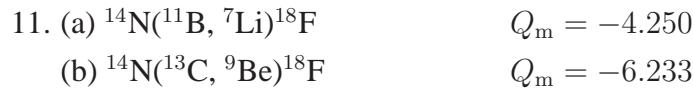

The total cross sections for formation of  $^{10}\text{B}$  and  $^6\text{Li}$  have been studied for  $E_\alpha = 21$  to  $42 \text{ MeV}$  [see ([1978AJ03](#))], as has the cross section for production of  $1.64$  and  $2.31 \text{ MeV}$   $\gamma$ -rays from threshold to  $E_\alpha = 26 \text{ MeV}$  ([1985DY05](#)). See also ([1987AJ02](#)), and see ([1987BU27](#), [1989BE1R](#), [1990WE14](#), [1991LE33](#)).

9. (a)  $^{14}\text{N}(^6\text{Li}, d)^{18}\text{F}$   $Q_m = 2.940$   
 (b)  $^{14}\text{N}(^6\text{Li}, d\alpha)^{14}\text{N}$   $Q_m = -1.475$

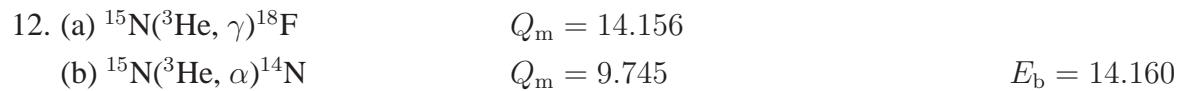

Angular distributions have been measured for the deuteron groups to  $^{18}\text{F}^*(5.34 [4^+], 6.56 [5^+], 9.58, 11.2, 14.1)$  at  $E(^6\text{Li}) = 36$  MeV. Angular correlations lead to  $J^\pi = 6^+$  and  $8^+$  for  $^{18}\text{F}^*(9.58, 14.1)$  and the data are consistent with  $J^\pi = 7^+$  for  $^{18}\text{F}^*(11.2)$  ([1983ET02](#)). For the earlier work see ([1978AJ03](#)).

At  $E(^7\text{Li}) = 36$  MeV the  $K^\pi = 1^+$  band appears to be selectively populated. States at  $E_x = 9.58 \pm 0.02, 11.22 \pm 0.03$  and  $14.18 \pm 0.04$  MeV are strongly populated. It is suggested that the first two are the  $6^+$  and  $7^+$  members of that band: see reaction 8. [Angular distributions are reported for  $^{18}\text{F}^*(1.70, 2.10, 2.52, 3.36, 4.40, 5.30, 6.57, 9.58, 11.22, 14.18)$ .] See ([1978AJ03](#), [1987AJ02](#)) for the earlier work.

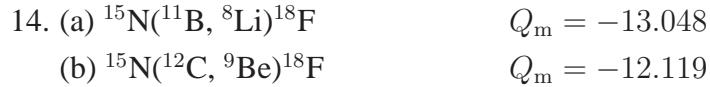

These reactions have been studied at  $E(^{11}\text{B}) = 115$  MeV and  $E(^{13}\text{C}) = 105$  MeV. Differential cross sections at three angles are reported for the transitions to  $^{18}\text{F}^*(9.58, 10.57 \pm 0.07, 11.2)$  in reaction (a) and to  $^{18}\text{F}^*(5.30, 6.57, 9.58, 10.60 \pm 0.08, 11.2)$  in reaction (b). In addition to these states  $^{18}\text{F}^*(14.18)$  is strongly excited in both reactions, and transitions to  $^{18}\text{F}^*(15.79 \pm 0.10, 18.62 \pm 0.12)$  are also reported: see ([1983AJ01](#)).

Excitation functions have been measured for  $E(^3\text{He}) = 2.5$  to  $16$  MeV for the  $\gamma_0$  and  $\gamma_{1 \rightarrow 4}$  yields. Resonances are observed corresponding to  $E_x = (19.00 \pm 0.15) [\gamma_{1 \rightarrow 4}], (20.1 \pm 0.2) [\gamma_0, \gamma_{1 \rightarrow 4}], (22.7 \pm 0.2) [\gamma_0, \gamma_{1 \rightarrow 4}]$  and  $(24.1 \pm 0.2)$  MeV  $[\gamma_{1 \rightarrow 4}]$ , with  $\Gamma_{c.m.} = (0.5 \pm 0.15), (1.6 \pm 0.1), (1.2 \pm 0.1)$  and  $(1.4 \pm 0.3)$  MeV, respectively. The  $\gamma_0$  yield is dominated by  $^{18}\text{F}^*(20.10)$  [[\(1983WA05\)](#): see for  $(2J + 1)\Gamma_{^3\text{He}}\Gamma_\gamma$  values]. It is suggested that structures decaying by  $\gamma_0$  have  $J^\pi = 2^-$  (and possibly  $T = 1$ ) ([1983WA05](#)). For analyzing power measurements at  $E(^3\text{He}) = 33$  MeV see ([1986DR03](#)).

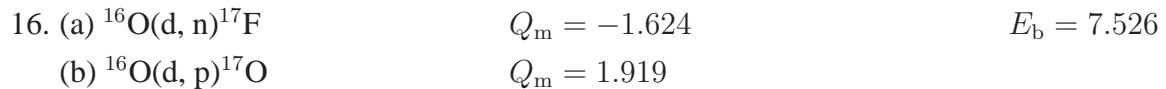

At  $E(^6\text{Li}) = 30$  MeV preferential excitation of odd-parity states of  $^{18}\text{F}$  below  $E_x = 5$  MeV is reported. Angular distributions of the tritons to  $^{18}\text{F}^*(0, 0.94, 2.10, 4.40)$  [ $J^\pi = 1^+, 3^+, 2^-, 4^-$ ] are all strongly forward peaked: see ([1978AJ03](#)).

These reactions have been studied with  $E(^{11}\text{B}) = E(^{12}\text{C}) = 115$  MeV. Reaction (a) is dominated by the transitions to  $^{18}\text{F}^*(1.12)$  [presumably  $J^\pi = 5^+$  state, although the group is unresolved] and to  $^{18}\text{F}^*(7.15, 9.45)$  [ $J^\pi = (7^-)$  and  $(6^-)$ ]. No single state is strongly preferentially populated in reaction (b). Differential cross sections for  $^{18}\text{F}^*(4.40, 6.10, 7.15, 9.45)$  [ $J^\pi = 4^-, (5^-), (7^-), (6^-)$ ], are fitted by FRDWBA: see ([1983AJ01](#)).

The capture cross section rises from  $0.1 \mu\text{b}$  at  $E_{\text{d}} = 0.4$  MeV to  $25 \mu\text{b}$  at  $3.5$  MeV:  $\Gamma_\gamma$  over this range is  $\approx 2$  eV: see ([1972AJ02](#)).

Excitation functions and polarization studies have been carried out to  $E_{\text{d}} = 17$  MeV [see ([1978AJ03](#), [1983AJ01](#))] and at  $E_{\text{d}} \approx 5.6$  to  $8.3$  MeV ([1985GR1B](#);  $p_0, p_3, p_4$ ). Structures attributed to states in  $^{18}\text{F}$  are displayed in Table 18.28. See also  $^{17}\text{O}$  and  $^{17}\text{F}$  in ([1986AJ04](#), [1993TI07](#)), ([1987AJ02](#)), and see ([1992LA08](#)) for applications.

The yields and polarized observables of elastically scattered deuterons have been reported for  $E_{\text{d}} = 0.65$  to  $56$  MeV: see ([1978AJ03](#), [1983AJ01](#)). More recent measurements are those by ([1985GR1B](#)) [excitation functions for  $E_{\text{d}} \approx 5.6$  to  $8.3$  MeV] and the polarization studies at  $E_{\text{d}} = 20.5$  MeV ([1984FR14](#); TAP),  $56$  MeV ([1986MA32](#), VAP, TAP) and  $200, 400$  and  $700$  MeV ([1987NG01](#); VAP, TAP). An analysis for  $E_{\text{d}} = 400$  MeV in terms of the folding model is discussed in ([1987GR16](#)). Virtual breakup effects in ( $\text{d}, \text{d}'$ ) elastic scattering have been studied ([1988IS02](#)). For references to earlier work see ([1987AJ02](#)), and see the  $^{16}\text{O}$  sections of ([1986AJ04](#), [1993TI07](#)).

$$Q_m = 3.111$$

$$E_b = 7.526$$

The yields of various groups of  $\alpha$ -particles have been measured for  $E_d \leq 20$  MeV: see ([1978AJ03](#), [1983AJ01](#)). The yield curves have been fitted in terms of a large number of states in  $^{18}\text{F}$ : see Table [18.28](#) here, and 18.16 in ([1978AJ03](#)).

Table 18.28: Maxima in the yields of  $^{16}\text{O} + \text{d}$  <sup>a</sup>

$E_d$ (MeV $\pm$ keV)	Particles out	$\Gamma_{\text{c.m.}}$ (keV)	$J^\pi; T$	$E_x$ (MeV)
0.895	$p_1, \alpha_0$	$210 \pm 25$		(8.320)

11.15	$\alpha_3$	70	$4^-, 5^+, 6^-$	17.43

<sup>a</sup> For references see Table 18.15 in (1978AJ03). This table does not include the structures in  $\alpha_1$  leading to isospin-mixed states in  $^{18}\text{F}$ ; for the latter see Table 18.16 in (1978AJ03).

A detailed study by (1973JO13) of the isospin-forbidden  $\alpha_1$  yield, analyzed by  $S$ -matrix theory, identifies a large number of isospin-mixed states in  $^{18}\text{F}$ , possibly as many as 138 with  $9.2 < E_x < 19.4$  MeV. The reaction mechanism appears to be almost entirely compound nuclear. The isospin impurity, averaged over 1 MeV intervals, is 3–10% for the above  $E_x$  range. The average coherence width increases from  $\approx 100$  keV at  $E_x = 14$  MeV to  $\approx 500$  keV at  $E_x = 20$  MeV. The level densities appear to be consistent with predictions of the Fermi-gas model (1973JO13). See also (1985JOZZ). [For mixed isospin states observed in  $^{14}\text{N}(\alpha, \alpha_1)$  see Table 18.14 in (1978AJ03).] Polarized beam measurements are reported for  $E_{\text{d}} = 6.8$  to 16 MeV: see (1978AJ03, 1983AJ01).

Vector and tensor polarized beam measurements are reported for the transitions to  ${}^{12}\text{C}^*(0, 4.4)$  at  $E_{\text{d}} = 18$  and  $22$  MeV ([1987TA07](#); VAP, TAP) and  $51.7$  MeV ([1986YA12](#); VAP; also to  ${}^{12}\text{C}^*(14.1)$ ).

Recent measurement of neutron yields for  $E_{\text{x}} = 20$  MeV are discussed in ([1993DR03](#), [1993DR04](#)). Applications are discussed in ([1987BO16](#), [1990BA1S](#)). For earlier work see ([1983AJ01](#), [1987AJ02](#)).

Excitation energies derived from measurements of  $\gamma$ -rays are displayed in Table 18.29 together with  $l$ -assignments obtained from distorted-wave analyses, and  $J^\pi$ ,  $T$  and  $K^\pi$  assignments from branching ratios, radiative widths, linear polarization,  $\gamma$ -ray angular distributions and  $\tau_{\text{m}}$  measurements [see also Tables 18.25 and 18.26]. Studies of this reaction, together with the work on  ${}^{14}\text{N}(\alpha, \gamma)$  and  ${}^{17}\text{O}(\text{p}, \gamma)$ , have defined the low-lying states of  ${}^{18}\text{F}$ .

The g-factor of  ${}^{18}\text{F}^*(0.94)$  [ $J^\pi = 3^+$ ] is  $(+0.56 \pm 0.05)$ : see ([1983AJ01](#)). The circular polarization of the  $1.08$  MeV  $\rightarrow$  g.s.  $\gamma$ -ray,  $P_\gamma = (-10 \pm 18) \times 10^{-4}$  ([1982AH07](#)),  $(2.7 \pm 5.7) \times 10^{-4}$  ([1985BI03](#), [1988BI07](#)),  $(1.6 \pm 5.6) \times 10^{-4}$  ([1985EV03](#)),  $(1.7 \pm 5.8) \times 10^{-4}$  ([1987PA07](#)). The weak pion-nucleon coupling constant deduced from the weighted average of all recent  $P_\gamma$  measurements  $[(1.2 \pm 3.9) \times 10^{-4}]$  is  $(0.3^{+1.0}_{-0.3}) \times 10^{-7}$ . Together with PNC matrix elements in other experiments this suggests that the isovector weak NN interaction may be strongly suppressed compared with the isoscalar weak NN interaction ([1985EV03](#), [1987PA07](#)). For a measurement of the ICC of the  $0.94$ ,  $1.02$ ,  $1.04$ , and  $1.08$  MeV  $\gamma$ -rays see ([1986KR04](#)). See also ([1978AJ03](#), [1983AJ01](#), [1987AJ02](#)) and  ${}^{19}\text{Ne}$ .

A discussion of nuclear tests of fundamental interactions is presented in ([1989MC1C](#)). For recent work on the use of this reaction for oxygen analysis, see ([1991BA62](#), [1992CO08](#)). For applications related to  ${}^{18}\text{F}$  production see ([1991GU05](#), [1991SU17](#)).

Angular distributions of the deuteron groups to  ${}^{18}\text{F}^*(1.12)$  [ $J^\pi = 5^+$ ] have been studied at  $E_\alpha = 28.0$  to  $33.6$  MeV: see ([1983AJ01](#)). At  $E_\alpha = 65.3$  MeV a number of angular distributions are reported to  ${}^{18}\text{F}$  states with  $E_{\text{x}} \leq 11.4$  MeV:  ${}^{18}\text{F}^*(9.49, 10.54)$  are suggested to have  $J^\pi = 6^-$  and  $7^+$  respectively ([1986KA36](#)). See, however, reactions 9 and 10. The use of this reaction in  ${}^{18}\text{F}$  production is discussed in ([1991GU05](#)).

Angular distributions have been measured at  $E(^6\text{Li}) = 5.5$  to  $34$  MeV [see (1983AJ01)] and at  $E(^6\text{Li}) = 48$  MeV (1984CO05;  $\alpha_0, \alpha_1, \alpha_4$ ). (1982FR15) report the excitation of a state at  $E_x = 4848 \pm 0.5$  keV which decays  $(35 \pm 4)\%$  to  $^{18}\text{F}^*(3.79)$  [ $E_\gamma = 1056.8 \pm 0.4$  keV] and  $(65 \pm 4)\%$  to  $^{18}\text{F}^*(1.12)$ . Alpha-gamma angular correlations are consistent with  $J^\pi = 5^-$ , and  $T = 0$  (1982FR15). See also (1986GL02) and (1986IC01).

$3061.84 \pm 0.18$	$5668 \pm 2$
$3133.87 \pm 0.15$	$6136.47 \pm 0.33$

<sup>a</sup> See also Table 18.31 here, and Table 18.17 in (1983AJ01).

$$Q_m = 5.607$$

Gamma-ray measurements lead to the very accurate  $E_x$  determinations for  $^{18}\text{F}$  states below 6.2 MeV: see Table 18.30. Observed resonances are displayed in Table 18.31; branching ratios, radiative widths and multipole mixing ratios are shown in Table 18.25; and  $\tau_m$  in Table 18.26.

The direct capture cross section has been studied for  $E_p = 0.3$  to  $1.9$  MeV:  $^{18}\text{F}^*(5.603, 5.605, 5.668, 5.786$  MeV) have  $J^\pi = 1^+, 1^-, 1^-$  and  $2^-$ . The  $1^-$  states have mixed isospin. For astrophysical work, see the thermonuclear reaction rate tables in (1985CA41) and the analytical expression presented in (1988CA26). See also (1978AJ03, 1983AJ01, 1987AJ02).

$$Q_m = -3.543$$

$$E_b = 5.607$$

Observed resonances are displayed in Table 18.31. Analyzing power measurements are reported at  $E_p = 135$  MeV (1983PUZZ; n<sub>0</sub>).

For astrophysics-related work see the thermonuclear reaction rate tables of (1985CA41) and the analytical expressions of (1988CA26).

$$E_b = 5.607$$

The elastic scattering has been studied for  $E_p = 0.5$  to  $13$  MeV [see (1978AJ03, 1983AJ01)]: observed anomalies are displayed in Table 18.31. Analyzing powers have been measured at  $E_p = 89.7$  MeV (1985VO12).

$$28. \ ^{17}\text{O}(\text{p}, \text{t})^{15}\text{O} \quad Q_{\text{m}} = -11.325 \quad E_{\text{b}} = 5.607$$

Analyzing powers have been reported at  $E_{\text{p}} = 89.7$  MeV for the triton groups to a number of  $^{15}\text{O}$  states ([1985VO12](#)).

$$29. \ ^{17}\text{O}(\text{p}, \alpha)^{14}\text{N} \quad Q_{\text{m}} = 1.192 \quad E_{\text{b}} = 5.607$$

The yield of  $\alpha_0$  shows a number of resonances for  $E_{\text{p}} = 0.49$  to 3.0 MeV: see Table 18.31. The R-matrix fit of ([1979KI13](#)), obtained using data from  $E_{\text{p}} = 400$  to 1400 keV, confirms the earlier result [see, e.g., reaction 31 in ([1978AJ03](#))] that a significant quantity of  $^{17}\text{O}$  is burned up in the  $(\text{p}, \gamma)$  rather than in the  $(\text{p}, \alpha)$  reaction for a wide range of stellar temperatures ([1979KI13](#)). See also ([1987AJ02](#), [1987AS05](#)).

Table 18.31: Resonances in  $^{17}\text{O} + \text{p}$ <sup>a</sup>

$E_{\text{p}}$ (keV)	Particles out	$\Gamma_{\text{c.m.}}$ (keV)	$(2J+1)\Gamma_{\gamma}\Gamma_{\text{p}}/\Gamma$ (eV)	$J^{\pi}; T$	$E_{\text{x}}$ (MeV ± keV)

<sup>a</sup> For references see Tables 18.18 in ([1978AJ03](#), [1983AJ01](#)).

<sup>b</sup> See footnote <sup>d</sup> in Table 18.18 ([1978AJ03](#)).

<sup>c</sup> This corresponds to a doublet of  $3^-$ , mixed isospin states, separated by  $2.09 \pm 0.04$  keV.  $\omega\gamma_{\text{p},\gamma} = 2.04 \pm 0.45$  eV for the lower resonance and  $1.16 \pm 0.26$  eV for the higher one.

<sup>d</sup>  $\Gamma_{\gamma} = 3.5 \pm 1.0$  eV.

<sup>e</sup>  $\Gamma_{\gamma} = 0.44 \pm 0.10$  eV.

<sup>f</sup>  $\Gamma_{\gamma} = 0.11 \pm 0.03$  eV.

<sup>g</sup> Assumed to be unresolved.

Measurements ([1989BO01](#); see  $^{14}\text{N}(\alpha, \gamma)^{18}\text{F}$  reaction) of the first level ( $J^{\pi} = 1^-$ ) of  $^{18}\text{F}$  above the proton threshold determined  $E_{\text{x}} = 5672.57 \pm 0.32$  keV. This result and a new value for the proton width of this level deduced from  $^{17}\text{O}(^{3}\text{He}, \text{d})^{18}\text{F}$  measurements ([1989LA19](#)) lead to substantial changes in the stellar reaction rate for  $^{17}\text{O}(\text{p}, \alpha)^{14}\text{N}$ . [See discussion in ([1989LA19](#)).] A direct search for the  $E_{\text{x}} = 70$  keV resonance ( $E_{\text{p}} = 5672.57 \pm 0.32$  keV) was carried out and an upper limit for the resonance strength ( $\omega\gamma \leq 8 \times 10^{-10}$  eV) was reported in ([1992BE21](#)).

$$30. \ ^{17}\text{O}(^{3}\text{He}, \text{d})^{18}\text{F} \quad Q_{\text{m}} = 0.113$$

At  $E(^3\text{He}) = 15$  MeV DWBA analysis of angular distributions of deuteron groups corresponding to states of  $^{18}\text{F}$  with  $E_{\text{x}} < 5$  MeV have led to  $J^{\pi}$  values and spectroscopic information: see ([1972AJ02](#)). Proton widths of states near the proton threshold were measured by ([1989LA19](#)). See also ([1987ER05](#)).

$$31. \ ^{17}\text{O}(\alpha, \text{t})^{18}\text{F} \quad Q_{\text{m}} = -14.207$$

Table 18.32: Some states in  $^{18}\text{F}$  from  $^{17}\text{O}(\alpha, \text{t})$ <sup>a</sup>

<sup>a</sup> (1992YA08);  $E_\alpha = 65$  MeV.

<sup>b</sup>  $E_x$  and  $J^\pi$  values from (1987AJ02).

<sup>c</sup> Integrated cross section. See Tables III and IV in (1992YA08) for spectroscopic factors.

<sup>d</sup>  $J^\pi$  value assumed in analysis by (1992YA08).

Measurements and DWBA analysis of differential cross sections at  $E_\alpha = 65$  MeV are reported in (1992YA08). Measured level energies and spectroscopic information are included in Table 18.32.

See (1983AJ01).

See (1983AS01, 1984AS05, 1989LE1L).

(1983AN05) have studied the distribution of Gamow-Teller (GT) strength. At  $E_p = 135$  MeV angular distributions have been studied to the  $0^+$  state at 1.04 MeV and to the  $1^+$  states  $^{18}\text{F}^*(0, 1.70, 3.72, 4.36, 6.26$  MeV) as well as to possible  $1^+$ ;  $T = 1$  groups at  $E_x = 9.9, 10.9$  and  $11.9$  MeV. 82% of the observed strength lies in the ground state group and 5.5% in the  $T = 1$  states. The observed GT strength is  $\approx \frac{2}{3}$  of that expected from the simple sum rule (1983AN05). Multipole decomposition of data from measurements at  $E_p = 494$  MeV is reported in (1994ME07). See also (1978AJ03, 1987AJ02).

More recently the (p, n) reaction as a probe of beta decay strength is discussed in (1987GO1V, 1987TA13, 1988MA53). See also (1989RA1G). Studies of stretched state excitation are described in (1986AN1E) and measurement of spin observables at  $E_p = 135$  MeV are discussed in (1989WAZZ, 1990WAZT). Total cross sections for  $^{18}\text{O}$  production from  $^{18}\text{O}(\text{p}, \text{n})$  were measured by (1990WA10). See (1988HI1F, 1991GU05) for related applications.

At  $E(^3\text{He}) = 16$  MeV, the triton spectrum is dominated by strong groups to  $^{18}\text{F}^*(0, 0.94)$  and to the  $0^+$  and  $2^+$ ,  $T = 1$  states  $^{18}\text{F}^*(1.04, 3.06)$ . Angular distributions have been studied to these and many other states at this energy and at  $E(^3\text{He}) = 17.3$  MeV.  $A_y$  measurements for t<sub>0</sub> have been reported at  $E(^3\text{He}) = 33$  MeV. See (1983AJ01) for references.

Table 18.33: Branching in  $^{18}\text{Ne}(\beta^+)^{18}\text{F}$ <sup>a</sup>

Decay to $^{18}\text{F}^*$ (MeV)	$J^\pi; T$	$E_{\gamma_0}$ (keV)	Branch <sup>b</sup> (%)	$\log f_0 t$ <sup>c</sup>
0	$1^+; 0$		$92.11 \pm 0.21$	$3.096 \pm 0.004$
1.04 <sup>d</sup>	$0^+; 1$	$1041.5 \pm 0.3$	$7.70 \pm 0.21$	$3.473 \pm 0.013$
1.08 <sup>d</sup>	$0^-; 0$	$1080.76 \pm 0.13$ <sup>b</sup>	$(2.07 \pm 0.28) \times 10^{-3}$	$7.012 \pm 0.059$
1.70	$1^+; 0$	$1699.9 \pm 0.3$ <sup>e</sup>	$0.188 \pm 0.006$	$4.477 \pm 0.015$

<sup>a</sup> For the earlier work see Tables 18.19 in (1983AJ01) and 18.20 in (1978AJ03).

<sup>b</sup> (1983AD03). See also (1982HE04).

<sup>c</sup> Based on  $\tau_{1/2} = 1672 \pm 8$  ms: see (1983AD03).

<sup>d</sup> The splitting of the  $0^+$  and  $0^-$  states is  $39.20 \pm 0.11$  keV (1983AD03).

<sup>e</sup> And  $659.2 \pm 0.3$  keV for the  $\gamma$ -ray to  $^{18}\text{F}^*(1.04)$  (1982HE04).

The reaction was studied at  $E(^6\text{Li}) = 156$  MeV by (1990MO13). Evaluated cross sections for Gamow-Teller transitions at  $0^\circ$  and strengths for analogous beta decays were compared.

The half-life of  $^{18}\text{Ne}$  is  $1672 \pm 8$  ms [see  $^{18}\text{Ne}$ ]. The decay is to  $^{18}\text{F}^*(0, 1.04, 1.08, 1.70 \text{ MeV})$ : see Table 18.33 and reaction 1 under  $^{18}\text{Ne}$ .

Cross sections have been reported to 30 MeV for the transitions to  $^{18}\text{F}^*(0.94, 1.04, 1.08, 3.06, 3.13, 4.75 \text{ MeV})$ : see (1983AJ01).

Cross sections for the  $(\gamma, n_0)$  photoneutron reaction were measured between  $48^\circ$  and  $139^\circ$  for  $E_\gamma = 15\text{--}25$  MeV by (1989KU10). The E1 absorption strength was deduced.

Cross sections have been measured at  $E_n = 18, 21, 23, 25$ , and  $27$  MeV (1991HA17).

Table 18.34:  $\gamma$ -ray intensities in  $^{18}\text{Ne}(\beta^+)^{18}\text{F}$ <sup>a</sup>

$E_\gamma$ (keV)	$E_i$ (keV)	$E_f$ (keV)	$I_\gamma$ <sup>b</sup>
$659.0 \pm 0.2$	1701	1042	$0.135 \pm 0.005$
$1041.55 \pm 0.08$	1042	0	$7.83 \pm 0.21$
$1080.76 \pm 0.13$	1081	0	$0.00226 \pm 0.00021$
$1700.81 \pm 0.18$	1701	0	$0.0538 \pm 0.0018$

<sup>a</sup> (1983AD03).

<sup>b</sup>  $\gamma$ -ray intensities are per 100 parent decays.

Angular distributions have been reported to many states of  $^{18}\text{F}$  with  $E_x \leq 6$  MeV: see Table 18.20 in (1983AJ01). See also (1987AJ02). Spectroscopic factors derived from measurements of  $E_p = 18.6$  MeV are discussed in (1987VA28). See also (1989VAZM).

See (1972AJ02, 1978AJ03), and see (1989VAZM) for cross section measurements and deduced level energies and spectroscopic factors. A recent measurement of total cross sections at  $E_d = 5\text{--}12$  MeV (1993AB18) detected eight resonances with widths  $\Gamma \approx 200\text{--}400$  keV.

See (1978AJ03, 1987VA1I, 1988GOZB), and see (1989VAZM) for cross section measurements and deduced level energies and spectroscopic factors.

See (1978AJ03).

At  $E_d = 11$  MeV  $\alpha$ -groups are observed to many states of  $^{18}\text{F}$  with  $E_x < 7$  MeV. Weak or absent (each  $\leq 0.3\%$  of the total yield at  $30^\circ$ ) are the groups corresponding to  $^{18}\text{F}^*(1.04, 3.06,$

4.66, 4.74, 4.96 MeV):  $T = 1$ . Measurements of the TAP for  $E_d = 10.25$  to 12.0 MeV leads to assignments of  $2^-$ ,  $1^+$ ,  $0^+$ ,  $1^-$ ,  $1^+$ ,  $3^+$ ,  $3^+$  to  $^{18}\text{F}^*(4.23, 4.36, 4.75, 4.86, 5.603, 6.16, 6.48 \text{ MeV})$ . See ([1972AJ02](#), [1978AJ03](#), [1983AJ01](#)) for references and for other results and ([1987HI1B](#)) for applications. Use of this reaction for  $^{18}\text{F}$  production is discussed in ([1991GU05](#)).

See ([1987GOZX](#)).

The  $^{18}\text{F}$  yield from protons on  $^{23}\text{Na}$  at  $E_p = 20$ –67.5 MeV was measured ([1992LA25](#)) and cross sections were deduced.

See ([1984NE1A](#)).

Cross sections have been measured for  $E(^{16}\text{O}) = 13.6 \text{ GeV/nucleon}$  by ([1993CU05](#)).

**$^{18}\text{Ne}$**   
(Figs. 4 and 5)

GENERAL: See Table 18.35.

For  $B(\text{E}2)$  of  $^{18}\text{Ne}^*$  (1.89) and other parameters see (1987RA01) and Table 2 here.

The half-life of  $^{18}\text{Ne}$  is  $1672 \pm 8$  ms: see (1978AJ03) and (1983AD03). The decay is primarily to  $^{18}\text{F}^*(0, 1.04, 1.70 \text{ MeV})$ . In addition there is an extremely weak branch [ $(2.07 \pm 0.28) \times 10^{-3}\%$ ] to  $^{18}\text{F}^*(1.08 \text{ MeV})$  [ $J^\pi = 0^-; T = 0$ ] (1983AD03): see Table 18.33 for the parameters of the decay. The parity mixing in the  $^{18}\text{F}^*(1.04, 1.08) 0^+ - 0^-$  doublet has been studied by (1983AD03). It has been proposed as a probe of  $T$ -odd nuclear forces (1992HE12). See also (1982HE04). For the earlier work see (1983AJ01, 1987AJ02).

This reaction was studied at  ${}^6\text{He}$  angles from  $0^\circ$  to  $10^\circ$  with a magnetic spectrometer (1992HAZZ). New levels at  $E_x > 6 \text{ MeV}$ , including  $^{18}\text{Ne}(6.15, 7.35 \text{ MeV})$ , were found. Astrophysical implications are discussed.

The thermonuclear reaction rates for this reaction have been estimated (1987WI11) using information from the isobaric analog  $^{18}\text{O}$ . A new  $^{18}\text{Ne}$  level at  $E_x = 6.15 \text{ MeV}$  (see  $^{16}\text{O}({}^3\text{He}, \text{n})$ ) has been observed (1990GAZW) which may play a role in  $^{14}\text{O} + \alpha$  burning. See also (1988CA26).

This reaction is considered important in the generation of  $Z \geq 10$  nuclei from products in the hot CNO cycle. Microscopic multichannel calculations for this reaction are discussed in (1988FU02, 1989FU01).

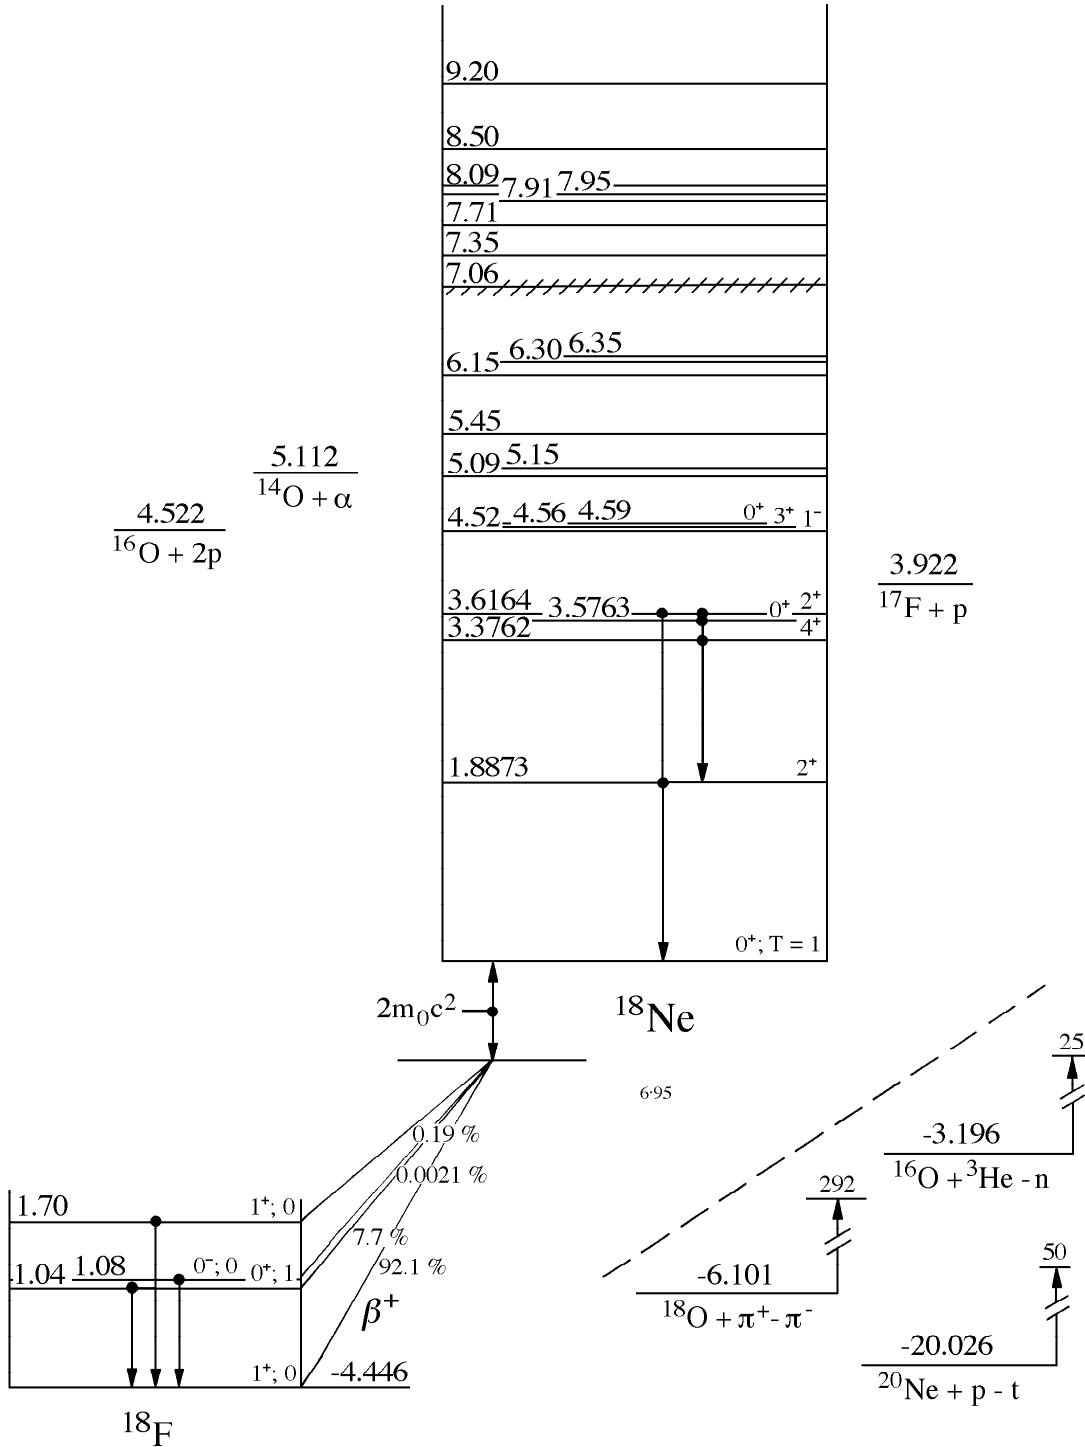

Fig. 4: Energy levels of  $^{18}\text{Ne}$ . For notation see Fig. 2.

<sup>a</sup> See also Table 18.37.

<sup>b</sup> (1990GAZW).

<sup>c</sup> (1992HAZZ). This work reports the observation of several new levels in the region  $E_x > 6$  MeV.

See Table 18.38. See also (1983AJ01).

Recent work reported in (1991GA03) found that the  $3^+$  level in  $^{18}\text{Ne}$  predicted by (1988WI08) occurs at  $E_x = 4.561 \pm 0.009$  MeV. Astrophysical consequences are discussed. New levels in  $^{18}\text{Ne}$  at  $E_x \geq 6$  MeV observed in  $^{16}\text{O}(^3\text{He}, n)$  were reported in (1990GAZW). [See discussion under  $^{14}\text{O}(\alpha, \gamma)^{18}\text{Ne}$ .] See also (1989GAZW, 1990GAZR). For applied work related to this reaction see (1991GU05, 1992DI04).

See (1991GU05) for measurements at  $E_\alpha = 40$  MeV.

Table 18.37: Branching ratios and lifetimes of  $^{18}\text{Ne}$  states <sup>a</sup>

$E_i$ (MeV)	$J_i^\pi$	$E_f$ (MeV)	Branch (%)	$\tau_m$ (ps)
1.89	$2^+$	0	100	$0.67 \pm 0.06$
3.38	$4^+$	1.89	100 <sup>b</sup>	$4.4 \pm 0.6$
3.58	$0^+$	1.89	100 <sup>c</sup>	$4 \pm 2$
3.62	$2^+$	0	$9 \pm 2$	
		1.89	$91 \pm 2$ <sup>d</sup>	$0.063^{+0.030}_{-0.020}$

<sup>a</sup> For references see Table 18.24 in (1978AJ03).

<sup>b</sup> Ground state decay is < 1%.

<sup>c</sup> Ground state decay is < 5%.

<sup>d</sup> The mixing ratio,  $\delta$ , is consistent with 0.

At  $E(^{10}\text{B}) = 100$  MeV, the angular distribution to  $^{18}\text{Ne}^*(3.38)$  [ $(d_{5/2})_{4+}^2$  state], which is preferentially populated, has been studied.  $^{18}\text{Ne}^*(1.89)$  is also observed (see (1983AJ01)). See also (1983OS07).

Measurements at  $E(^{12}\text{C}) = 480$  MeV are reported in (1988KR11, 1988ME10). The  $4^+$  level at  $E_x = 3.38$  MeV is observed.

Table 18.38: States in  $^{18}\text{Ne}$  from  $^{16}\text{O}(^3\text{He}, \text{n})$  and  $^{20}\text{Ne}(\text{p}, \text{t})$ <sup>a</sup>

A:  $^{16}\text{O}(^3\text{He}, \text{n})^{18}\text{Ne}$ : for references see Table 18.23 ([1978AJ03](#)) and ([1981NE09](#)).

B:  $^{20}\text{Ne}(\text{p}, \text{t})^{18}\text{Ne}$ : ([1981NE09](#)).

<sup>a</sup> See also Table 18.23 in ([1978AJ03](#)).

<sup>b</sup> ([1981NE09](#)).

<sup>c</sup> ([1991GA03](#)). The width  $\Gamma = 25$  keV is estimated from a Woods Saxon calculation.

<sup>d</sup>  $\Gamma = 180 \pm 60$  keV.

Angular distributions have been studied at  $E(\pi^+) = 164$  and  $292$  MeV [see (1983AJ01)] and at  $48.3$  MeV (1985AL15; to  $^{18}\text{Ne}_{\text{g.s.}}$ ) and  $100$  to  $292$  MeV (1985SE08; to  $^{18}\text{Ne}_{\text{g.s.}}$ ). The excitation functions for production of  $^{18}\text{Ne}^*(0, 1.89)$  have been measured for  $E(\pi^+) = 80$  to  $292$  MeV: see (1983AJ01, 1985SE08). See also (1987AJ02).

The behavior of double charge exchange (DCX) cross sections at low energies ( $50 \pm 30$  MeV) was reviewed in (1987PA1H, 1988SE1A, 1989BA1R). See also the review of (1989ST1H). Measurements at energies of  $300$ – $500$  MeV above the  $\Delta(1232)$  resonance were reported in (1989WI02). More recently a search for an  $\eta$  bound state in this reaction is described in (1992JOZZ, 1993JO03).

The contribution of the two-nucleon pion absorption emission mechanism is discussed in (1990CH14). See also (1989CH1O, 1990CH1U) and see (1989YU1A). A quark-antiquark annihilation mechanism is proposed in (1989CH21). A two-amplitude model for the DCX energy dependence is described in (1989FO02). In other recent work, the contribution of sequential charge exchange and delta-nucleon charge exchange is examined in (1993GI03). Absorption contributions near  $T_\pi = 50$  MeV are evaluated by (1992OS05). High energy DCX and isovector renormalization is calculated and compared with data in (1993OS01). See also (1992MA46) for a discussion of dibaryon effects.

Observed triton groups are displayed in Table 18.38 as are  $J^\pi$  derived from DWBA analysis of angular distributions: The  $0_3^+$  state, identified at  $E_x = 4.59$  MeV, appears to have a largely  $s_{1/2}^2$  configuration based on its large downward shift with respect to the analog state in  $^{18}\text{O}$  (1981NE09).

See (1991GU05).

$^{18}\text{Na}$   
(Not observed)

$^{18}\text{Na}$  has not been observed; its atomic mass excess has been estimated to be  $25.32$  MeV (1993AU05); it is then unbound with respect to proton emission by  $1.6$  MeV: see (1978AJ03). See also (1986AN07) and (1983ANZQ).

$^{18}\text{Mg, etc.}$   
(Not observed)

See (1986AN07) and (1983ANZQ). See also the results of calculations of  $\beta^+$ /electron capture half lives for neutron deficient nuclei in (1993HI08).

Table 18.39: Isospin triplet components ( $T = 1$ ) in  $A = 18$  nuclei <sup>a</sup>

<sup>a</sup> As taken from Tables 18.9, 18.24 and 18.36.

<sup>b</sup> Defined as  $E_x(^{18}\text{F}) - E_x(^{18}\text{O}) - 1.04$  MeV.

<sup>c</sup> Defined as  $E_x(^{18}\text{Ne}) - E_x(^{18}\text{O})$ .

Table 18.40: ( $T = 2$ ) states in  $^{18}\text{N}$  and  $^{18}\text{O}$ <sup>a</sup>

$^{18}\text{N}$		$^{18}\text{O}$	
$E_x$ (MeV)	$J^\pi$	$E_x$ (MeV)	$J^\pi; T$
0	$1^-$ <sup>b</sup>		
0.11	$(2^-)$ <sup>b, c</sup>	16.4	$2^-; 2$
0.59	$(2^-)$ <sup>b</sup>		
0.75	$(3^-)$ <sup>b, c</sup>	17.03	$(3^-); 2$
		17.4	$1^-; (2)$
		18.7	$(4^-); 2$
		18.9	$1^+; 2$
		19.24	$(> 2); 2$
		19.4	$1^-; (2)$
		20.36	$(4^-); 2$
		21.42	$(4^-); (2)$
		22.40	$4^-; 2$
		27	$1^-; (2)$

<sup>a</sup> As taken from Tables 18.4 and 18.9.

<sup>b</sup> Coulomb-shift computations (R. Sherr, private communication) for these four levels suggest that the analogs of the  $^{18}\text{N} 1^-$  and  $(2^-)$  levels at  $E_x = 0$  and 0.59 MeV are the  $^{18}\text{O} 1^{(-)}$  and  $(3, 2)^-$  levels at  $E_x = 16.21$  and 16.95 MeV respectively.

<sup>c</sup> It is noted (A.H. Wapstra, private communication) that the combined evidence on these two levels and their analogs in  $^{18}\text{O}$  is an argument for assignments of  $2^-$  and  $(3^-)$  in both nuclei, and in  $^{18}\text{O}$  they should lie above an unobserved  $1^-; 2$  state near 16.3 MeV.

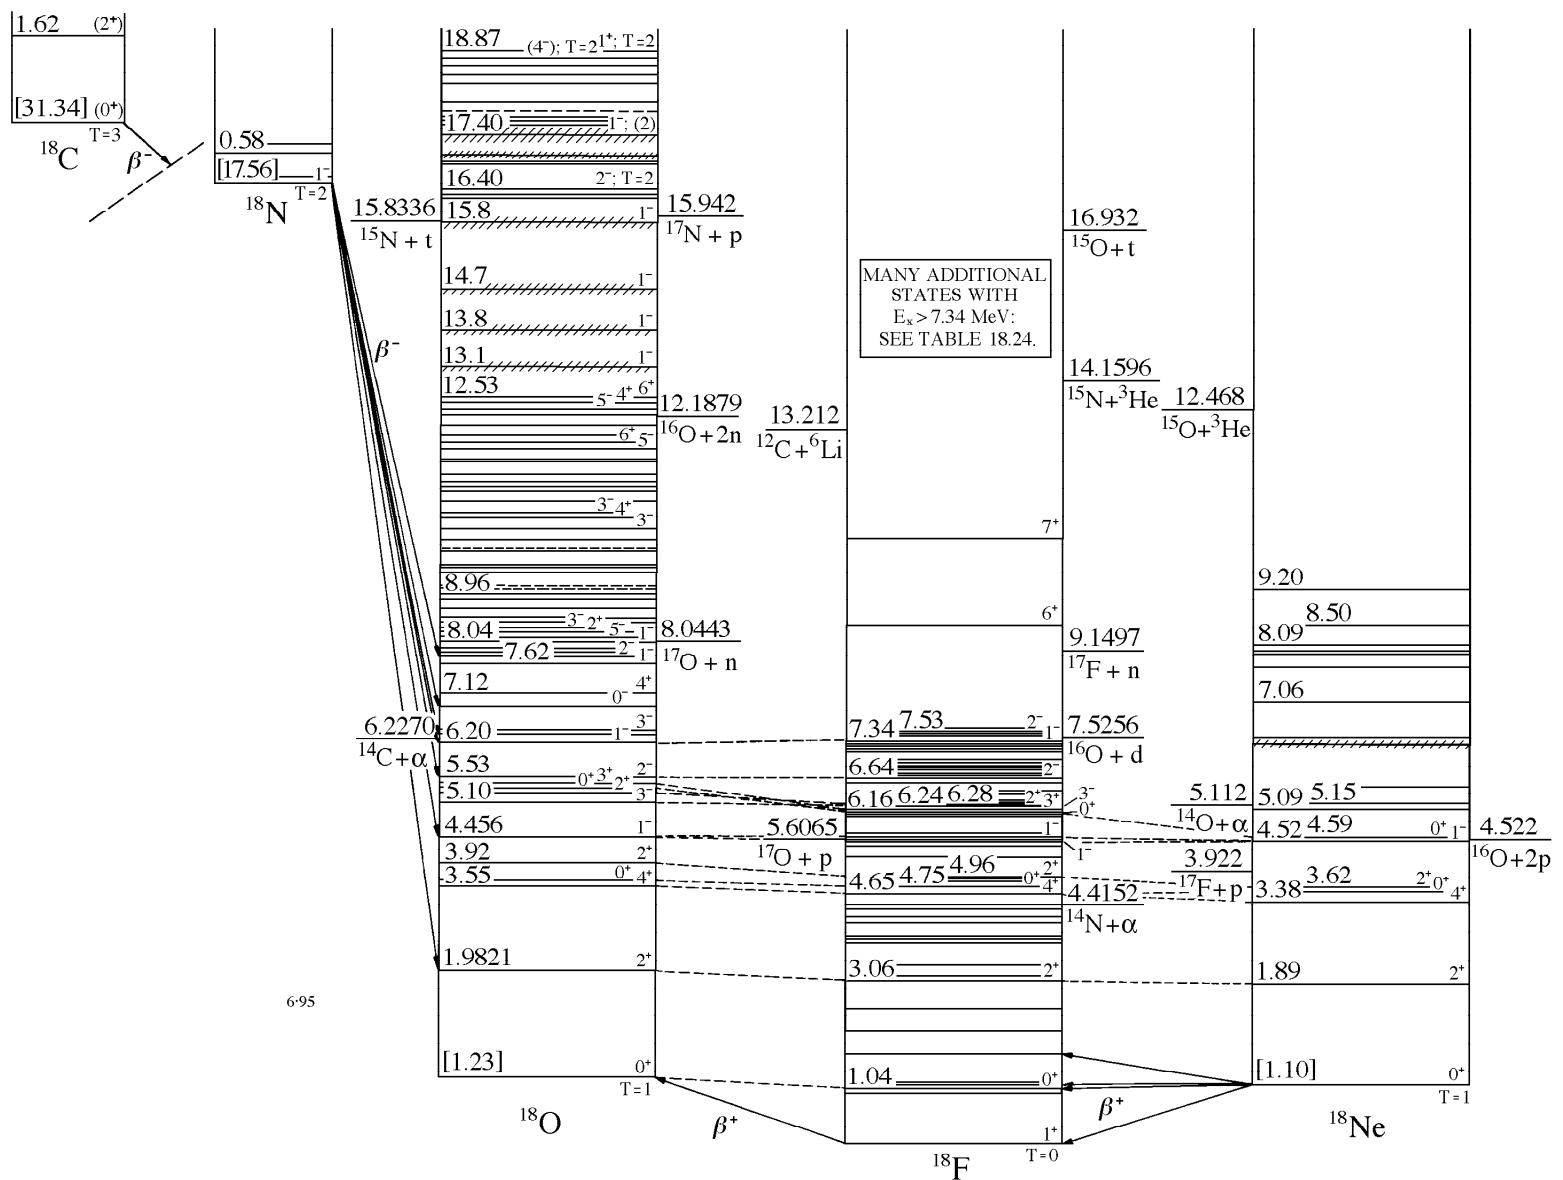

Fig. 5: Isobar diagram,  $A = 17$ . The diagrams for individual isobars have been shifted vertically to eliminate the neutron-proton mass difference and the Coulomb energy, taken as  $E_C = 0.60Z(Z - 1)/A^{1/3}$ . Energies in square brackets represent the (approximate) nuclear energy,  $E_N = M(Z, A) - ZM(H) - NM(n) - E_C$ , minus the corresponding quantity for  $^{18}\text{F}$ ; here  $M$  represents the atomic mass excess in MeV. Levels which are presumed to be isospin multiplets are connected by dashed lines.
