[a] (1971DO06, 1971ZE02). See Table 16.7 in (1971AJ02) for the earlier work.

[b] Below $E_n = 4.5$ MeV, the multilevel R-matrix formalism was used to determine E_λ, Γ_λ and whenever possible J^π by a χ^2 fitting and minimization technique. Above this energy the $2J + 1$ dependence was used; the parity cannot be determined because no marked interference effects are observed between resonance and potential scattering. Above 5.65 MeV all J-values are lower limits because the inelastic channel is open. [A channel radius $a = 4.69$ fm was used] (1971ZE02).

[c] Parity determined from angular distribution.

[d] J^π also obtained by phase-shift analysis.

[e] The phase-shift analysis indicates that the resonance is at $E_n = 2.42 \pm 0.08$ MeV with $\Gamma = 250 \pm 50$ keV. This is one of two $(d_{3/2}p_{1/2}^{-1})$ single-particle resonances (1971ZE02).

[f] The phase-shift analysis finds $E_\lambda = 2.94 \pm 0.1$ MeV, $\Gamma = 320 \pm 80$ keV. This is the other $(d_{3/2}p_{1/2}^{-1})$ single-particle resonance (1971ZE02).
