

Energy Levels of Light Nuclei $A = 17$

F. Ajzenberg-Selove

University of Pennsylvania, Philadelphia, Pennsylvania 19104-6396

Abstract: An evaluation of $A = 16-17$ was published in *Nuclear Physics A375* (1982), p. 1. This version of $A = 17$ differs from the published version in that we have corrected some errors discovered after the article went to press. Figures and introductory tables have been omitted from this manuscript. Also, [Reference](#) key numbers have been changed to the NNDC/TUNL format.

^{17}Be

(Not illustrated)

This nucleus has not been observed. Its atomic mass excess is calculated to be 70.67 MeV. It is then unstable with respect to breakup into $^{16}\text{Be} + n$ and $^{15}\text{Be} + 2n$ by 3.37 and 3.34 MeV, respectively (1974TH01).

^{17}B

(Not illustrated)

^{17}B has been observed in the 4.8 GeV proton bombardment of uranium: it is particle stable and its ground state J^π is probably $\frac{3}{2}^-$ (1974BO05). Its atomic mass excess is calculated to be 44.37 MeV (transverse form of the mass equation): it is then stable with respect to decay into $^{15}\text{B} + 2n$ by 0.73 MeV (1974TH01, 1975JE02). The E_{β^-} (max) for the decay to ^{17}C would then be 23.3 MeV. See also (1977WA08) and (1981SE06; theor.).

^{17}C

(Fig. 9)

The Q -value of the $^{48}\text{Ca}(^{18}\text{O}, ^{17}\text{C})^{49}\text{Ti}$ reaction, studied at $E(^{18}\text{O}) = 102$ MeV, $\theta \approx 8^\circ$, leads to an atomic mass excess of 21.023 ± 35 keV. A group is also observed corresponding to an excited state of ^{17}C with $E_x = 292 \pm 20$ keV. Three closely spaced states with $J^\pi = \frac{1}{2}^+, \frac{3}{2}^+, \frac{5}{2}^+$ are predicted, based on systematics. The cross sections for formation of $^{17}\text{C}^*(0, 0.29)$ are 3 and 9 $\mu\text{b}/\text{sr}$, respectively, at $\theta_{\text{cm}} = 10.5^\circ$ (1977NO08). On the basis of the atomic mass excess given above, E_{β^-} (max) to $^{17}\text{N}_{\text{g.s.}} = 13.15$ MeV. ^{17}C is stable with respect to $^{16}\text{C} + n$ by 0.74 MeV. The Q -value of the $^{207}\text{Pb}(^{18}\text{O}, ^{17}\text{C})^{208}\text{Po}$ reaction is -26.87 ± 0.22 MeV, leading to a mass excess of 21.10 ± 0.22 MeV for the ground state (doublet) of ^{17}C (1979BA31).  (b) $^{17}\text{N}(\beta^-)^{17}\text{O}$ $Q_m = 8.680$

The half-life of ^{17}N is 4.173 ± 0.004 sec (1976OH05, 1972AL42). See also (1971AJ02). The decay is principally [see Table 17.2] to the neutron unbound states $^{17}\text{O}^*(4.55, 5.38, 5.94)$ [$J^\pi = \frac{3}{2}^-, \frac{3}{2}^-, \frac{1}{2}^-$]. The nature of the decay is in agreement with $J^\pi = \frac{1}{2}^-$ for $^{17}\text{N}_{\text{g.s.}}$ (1973PO11, 1976AL02). For a comparison of the ^{17}N and ^{17}Ne decays see Table 17.3 (1976AL02, 1976OH05).

- $^9\text{Be}(^9\text{Be}, \text{p})^{17}\text{N}$. $Q_m = 7.537$

Angular distributions are reported at $E(^9\text{Be}) = 5.0$ MeV to $^{17}\text{N}^*(0, 1.37, 2.53)$ (1977YO02).[†]

- $^{11}\text{B}(^7\text{Li}, \text{p})^{17}\text{N}$ $Q_m = 8.417$

Observed proton groups and γ -rays are displayed in Table 17.4. Table 17.5 shows branching ratio and lifetime measurements (1974RO27, 1974RO28).

^a (1979FO14): $E_t = 15.0$ MeV; DWBA analysis. See also (1978MO18).

^b Predominantly 2p-1h states.

^c Unresolved states.

^d $^{17}\text{N}^*(6.08)$ is not observed.

^e The $\frac{7}{2}^+$ possibility can be eliminated because the $4.21 \rightarrow 1.37$ MeV transition would then have too large an M2 strength (> 500 W.u.) [P.M. Endt, private communication].

The yield of neutrons increases monotonically for $E_\alpha = 0.475$ to 1 MeV: $S(E) = [(5.48 \pm 1.77) + (12.05 \pm 3.91)E] \times 10^5 \text{ MeV} \cdot \text{b}$ (1968DA05; $E_\alpha = 0.48$ to 0.70 MeV), $[(4.87 \pm 1.28) + (10.86 \pm 2.46)E] \times 10^5 \text{ MeV} \cdot \text{b}$ (1976RA36, 1977RA1C; $E_\alpha = 0.60$ to 0.90 MeV). Astrophysical considerations are discussed by (1976RA36, 1977CO1U, 1977RA1C) and see (1977AJ02). Yield curves for reaction (a) have been measured for $E_\alpha = 1.0$ to 22.5 MeV: see (1971AJ02, 1977AJ02) and (1975BE44; $\alpha\gamma_{6.13}$; thresh. to 7.2 MeV). Elastic scattering studies [(reaction (b))] have been studied at $E_\alpha = 2.0$ to 26.6 MeV: see (1971AJ02, 1977AJ02). Observed resonances are displayed in Table 17.8.

12. $^{13}\text{C}(^6\text{Li}, \text{d})^{17}\text{O}$	$Q_m = 4.886$
---	---------------

Angular distributions of deuteron groups to many states of ^{17}O have been measured earlier at $E(^6\text{Li}) = 18$ and 25.6 MeV: see Table 17.7 in (1977AJ02). At $E(^6\text{Li}) = 35.5$ MeV angular distributions are reported to $^{17}\text{O}^*(13.58 \pm 0.02)$ which is strongly populated. Comparisons with $^{12}\text{C}(^6\text{Li}, \text{d})^{16}\text{O}^*(16.29)$ and with the results of reaction 13 here suggest that the peak corresponding to $^{17}\text{O}^*(13.58)$ contains a state or states of spin $\frac{11}{2}^-$, $\frac{13}{2}^-$, or both, based on $^{16}\text{O}^*(16.29)$ (1978CL08). (d, α) angular correlations [$E(^6\text{Li}) = 26, 29$ and 34 MeV] indicate the involvement of ^{17}O states at 13.6 ± 0.1 [$l = 6$], 14.15 ± 0.1 [5], 15.1 ± 0.1 [5], 15.95 ± 0.15 [5], 16.6 ± 0.15 [6], 17.1 ± 0.15 [6], 19.6 ± 0.15 [7], 20.2 ± 0.15 [7], 21.2 [7] and 22.1 MeV. $\Gamma \approx 0.1, 0.5, 0.7, 0.25$ and 0.25 MeV for $^{17}\text{O}^*(14.2, 15.1, 16.0, 19.6, 20.2)$ (1978AR15). 13. $^{13}\text{C}(^7\text{Li}, \text{t})^{17}\text{O}$	$Q_m = 3.893$

Angular distributions of triton groups to many states of ^{17}O have been measured earlier at $E(^7\text{Li}) = 17, 20.5$ and 30.1 MeV: see Table 17.7 in (1977AJ02). At $E(^7\text{Li}) = 35.7$ MeV angular

distributions are reported to $^{17}\text{O}^*(3.06)$ and to $^{17}\text{O}^*(13.58)$ which is preferentially populated (see discussion in reaction 12). Narrow states at $E_x = 14.86, 18.17$ and 19.24 MeV are also strongly excited (1978CL08). See also (1978MA2G).

$$16. \ ^{14}\text{C}(^3\text{He}, \gamma)^{17}\text{O} \quad Q_m = 18.7611$$

The capture cross sections at 90° for γ_0 and for γ_1 have been studied for $E(^3\text{He}) = 3.2$ to 7.5 MeV and angular distributions of the γ -rays have been studied at the six observed resonances: see Table 17.9 (1976CH04).

18. $^{14}\text{C}(\alpha, \text{n})^{17}\text{O}$ $Q_{\text{m}} = -1.8167$

The upper limits to the decays $3.06 \rightarrow 0$ and $3.84 \rightarrow 0.87$ are, respectively, 2 and 5%. A study of n- γ correlations leads to $J^{\pi} = \frac{1}{2}^{-}$ and $(\frac{5}{2}^{-})$ for $^{17}\text{O}^*(3.06, 3.84)$ (1964AL11).

19. $^{14}\text{C}(^{16}\text{O}, ^{13}\text{C})^{17}\text{O}$ $Q_{\text{m}} = -4.0322$

Angular distributions have been measured at $E(^{16}\text{O}) = 20, 25$ and 30 MeV ($^{17}\text{O}^*(0, 0.87)$): see (1977AJ02). See also (1977WE1H; theor.).

The excitation functions for γ_0 and γ_1 have been measured for $E_{\text{t}} = 0.8$ to 3.3 MeV: broad resonances are observed at 2.2 and 2.8 MeV in the γ_0 cross section, and at 2.4 and 2.8 MeV in the γ_1 cross section. Both also exhibit a structure at 1.5 MeV. The data are consistent with states at $E_{\text{x}} = 19.76 \pm 0.06$ [$J^{\pi} = \frac{3}{2}$], 20.39 ± 0.05 [$\frac{5}{2}, \frac{7}{2}^{-}$], 20.58 ± 0.05 [$\frac{1}{2}$] and 21.05 ± 0.05 MeV [$\frac{3}{2}$] with $\Gamma = 0.55 \pm 0.05, 0.66 \pm 0.07, 0.57 \pm 0.08$ and 0.47 ± 0.06 MeV, and possibly with a state at ≈ 19.3 MeV. $\Gamma_{\gamma_0} > 1.0, 4.3$ and 5.8 eV for $^{17}\text{O}^*(19.8, 20.4, 21.1)$ and $\Gamma_{\gamma_1} > 2.3, 5.1$ and 6.5 eV for $^{17}\text{O}^*(19.8, 20.6, 21.1)$ (1980LO07).  (b) $^{14}\text{N}(\alpha, \alpha\text{p})^{13}\text{C}$ $Q_{\text{m}} = -7.55063$

Angular distributions have been measured for ^{17}O states with $E_x < 7.6$ MeV in the range $E_\alpha = 8.1 \rightarrow 33.3$ MeV: see a listing of the references in (1971AJ02). The sequential decay [reaction (b)] appears to take place via ^{17}O states with $8.46 \leq E_x \leq 13.57$ MeV. Those involved are believed to have $J \geq \frac{5}{2}$, $\Gamma_\alpha/\Gamma \geq 0.6$ (1969BA17).

At $E(^6\text{Li}) = 18$ MeV, the groups in this reaction and the triton groups in the mirror reaction (see reaction 8 in ^{17}F) have been compared: $^{17}\text{O}^*(3.84, 4.55, 5.22, 5.70+5.73)$ are strongly excited. $^{17}\text{O}^*(0, 0.87, 3.06, 5.09, 5.38, 5.87 + 5.94, 6.86, 6.97)$ are also populated (1973BI01). See also (1977MA2G, 1978MA2G).

$$23. \ ^{14}\text{N}(^{10}\text{B}, ^7\text{Be})^{17}\text{O} \quad Q_m = -0.045$$

See (1977MO1A).

$$24. \ ^{15}\text{N}(\text{d}, \gamma)^{17}\text{O} \quad Q_m = 14.0473$$

See (1977AJ02) [paper quoted there has not been published].

$$25. \ ^{15}\text{N}(\text{d}, \text{n})^{16}\text{O} \quad Q_m = 9.9029 \quad E_b = 14.0473$$

Excitation functions have been measured for a number of neutron groups for $E_d = 0.5$ to 5.9 MeV: a great deal of unresolved structure is apparent. Polarization measurements are reported for $E_d = 1.6$ to 5.5 MeV and at 10.0 and 11.8 MeV. See (1977AJ02) for a listing of the work. See also ^{16}O .

$$26. \ ^{15}\text{N}(\text{d}, \text{p})^{16}\text{N} \quad Q_m = 0.267 \quad E_b = 14.0473$$

Excitation functions have been obtained for $E_d = 0.3$ to 6.3 MeV: [see (1977AJ02)] and at $E_d = 1.4$ to 2.7 MeV (1977CA03; $p_0 \rightarrow p_3$). Structures are reported at $E_d = 1.8$ [p_0, p_1, p_3] and 2.4 MeV [p_2] [$^{17}\text{O}^*(15.6, 16.2)$] (1977CA03).

$$27. \ ^{15}\text{N}(\text{d}, \text{d})^{15}\text{N} \quad E_b = 14.0473$$

Excitation functions for d_0 have been measured for $E_d = 4.25$ to 6.25 MeV [see (1977AJ02)] and 1.4 to 2.7 MeV (1977CA03). The latter report structures at ≈ 1.4 and 1.8 MeV.

$$28. \text{}^{15}\text{N}(d, \alpha)\text{}^{13}\text{C} \quad Q_m = 7.6874 \quad E_b = 14.0473$$

Yield curves have been measured for $E_d = 0.8$ to 2.5 MeV [see (1977AJ02)] and 1.2 to 2.7 MeV (1976CA28; $\alpha_0 \rightarrow \alpha_3$): structures have been reported at $E_d = 1.06$ and 1.25 MeV, and at ≈ 1.8 MeV. The latter has $\Gamma \approx 300$ keV (1976CA28).

$$29. \text{}^{15}\text{N}(\text{}^3\text{He}, p)\text{}^{17}\text{O} \quad Q_m = 8.5537$$

Observed proton groups are displayed in Table 17.10. See also (1977AJ02). For the parameters of the first $T = \frac{3}{2}$ state see Table 17.11.

$$30. \text{}^{15}\text{N}(\alpha, d)\text{}^{17}\text{O} \quad Q_m = -9.7995$$

At $E_\alpha = 45.4$ MeV, the deuteron spectrum is dominated by the groups corresponding to states with $E_x = 7.742 \pm 0.020$ and 9.137 ± 0.030 MeV. These states are assigned $J^\pi = (\frac{11}{2}^-)$ and $(\frac{9}{2}^-)$ and arise from a dominant $(d_{5/2})^2_5 p_{1/2}^{-1}$ configuration. Angular distributions were measured as well for the deuterons corresponding to $^{17}\text{O}_{g.s.}$ and to states with $E_x = 0.87 \pm 0.05, 5.22, 5.70, 7.38, 8.46, 8.89$ and $9.81 [\pm 0.03]$ MeV. In addition the population of $^{17}\text{O}^*(3.84, 4.55, 8.15 \pm 0.03)$ is also reported (1969LU07).

$$31. \text{}^{15}\text{N}(\text{}^{11}\text{B}, \text{}^9\text{Be})\text{}^{17}\text{O} \quad Q_m = -1.769$$

At $E(^{11}\text{B}) = 115$ MeV angular distributions have been studied to $^{17}\text{O}^*(5.23, 7.75, 9.18) [J^\pi = \frac{9}{2}^-, \frac{11}{2}^-, \frac{9}{2}^-]$ (1979RA10, 1980PR09). See also (1977AJ02).

$$E_b = 4.1443$$

The scattering amplitude (bound) $a = 5.805 \pm 0.005$ fm, $\sigma_{\text{free}} = 3.761 \pm 0.007$ b (1979KO26). High resolution cross-section measurements and analyses of the elastic scattering and of the (n, α) and ¹³C(α, n) data have led to a much better understanding of the ¹⁷O structure below $E_x = 18.2$ MeV: see Table 17.12 (1973FO11, 1973JO01, 1980CI03, 1981HI01). (1973JO01) has performed a multi-level two-channel *R*-matrix analysis. Five states contain nearly 100% of the $1d_{3/2}$ strength and have their eigenenergy at $E_x \approx 5.7$ MeV [the dominant state is ¹⁷O*(5.08)]. Spectroscopic factors are deduced for 26 states in ¹⁷O for $4.5 < E_x < 9.5$ MeV [see Table 17.12 in (1977AJ02)]: the sum of these factors is 1% for $J^\pi = \frac{1}{2}^+$, 5% for $\frac{1}{2}^-$, 12% for $\frac{3}{2}^-$, 99% for $\frac{3}{2}^+$ m 0.1% for $\frac{5}{2}^+$, 1% for $\frac{5}{2}^-$ and 14% for $\frac{7}{2}^-$ (1973JO01). $T = \frac{3}{2}$ resonances are discussed by (1981HI01): see Tables 17.11 and 17.12.

Cross-section measurements are listed in Table 17.10 of (1971AJ02) and in (1977AJ02). At $E_n = 23.5$ keV, $\sigma_t = 3.736 \pm 0.007$ b (1975BI14; elemental O), σ_t has also been measured with high resolution for $E_n = 4.5$ to 8 MeV (1980CI03). At $E_n = 40.3$ and 50.4 MeV, σ_{non} is reported for elemental O (1981ZA03). Observed proton groups are displayed in Table 17.14 of (1977AJ02). Angular distributions have been measured at many energies in the range of $E_d = 0.3$ to 63.2 MeV: see Table 17.13 in (1971AJ02) and (1977AJ02), and at $E_d = 698$ MeV (1981BO03; p_0, p_1). At $E_d = 12$ MeV angular distributions are reported for the proton groups to $^{17}\text{O}^*(0, 0.87, 5.09)$: Γ_n for $^{17}\text{O}^*(5.09) = 97 \pm 5$ keV (1979AN15). Reported parameters for $^{17}\text{O}^*(0.87)$ are $\tau_m = 258.6 \pm 2.6$ psec [see Table 17.7 in (1971AJ02)] and $E_\gamma = 870.81 \pm 0.22$ keV [see (1977AJ02)], $E_\gamma = 870.725 \pm 0.020$ keV (1980WA24) [$E_x = 870.749 \pm 0.020$ keV (E.K. Warburton, private communication)].

42. $^{16}\text{O}(^7\text{Li}, ^6\text{Li})^{17}\text{O}$

$$Q_m = -3.106$$

The angular distribution involving $^{17}\text{O}_{\text{g.s.}}$ has been studied at $E(^7\text{Li}) = 36$ MeV. The population of $^{17}\text{O}^*(0.87, 3.06, 3.84, 4.55, 5.38)$ is also reported (1973SC26).

43. $^{16}\text{O}(^{11}\text{B}, ^{10}\text{B})^{17}\text{O}$

Angular distributions are reported at $E(^{11}\text{B}) = 115$ MeV to $^{17}\text{O}_{\text{g.s.}}$ (1979RA10). See also (1977AJ02).

44. (a) $^{16}\text{O}(^{12}\text{C}, ^{11}\text{C})^{17}\text{O}$

$$45. \ ^{16}\text{O}(^{14}\text{C}, ^{13}\text{C})^{17}\text{O} \quad Q_m = -4.032$$

See (1981KO07).

$$46. \ ^{16}\text{O}(^{14}\text{N}, ^{13}\text{N})^{17}\text{O} \quad Q_m = -6.409$$

At $E(^{14}\text{N}) = 79$ MeV angular distributions involving $^{17}\text{O}^*(0, 0.87)$ have been studied: an anomaly is observed in the phase behavior of the distribution to the excited state. From this and other studies it is concluded that a multistep process via inelastic scattering is unlikely to occur in the excitation of $2s_{1/2}$ states (1976MO03). An angular distribution involving $^{17}\text{O}^*(0 + 0.87)$ has also been reported at $E(^{14}\text{N}) = 155$ MeV (1975NA15). See also (1980IZ1B; theor.).

$$47. \ ^{16}\text{O}(^{18}\text{O}, ^{17}\text{O})^{17}\text{O} \quad Q_m = -3.900$$

At $E(^{18}\text{O}) = 42$ and 52 MeV, the angular distributions involving $^{17}\text{O}^*(0, 0.87)$ have been studied (1975RE15).

$$48. \ ^{17}\text{N}(\beta^-)^{17}\text{O} \quad Q_m = 8.680$$

The decay is principally to $^{17}\text{O}^*(4.55, 5.38, 5.94)$: see Table 17.2.

Forty-five resonances are reported for E_x up to 26.9 MeV in the differential cross section for (γ, n_0) . $T = \frac{1}{2}$ components of the giant resonance are observed at $E_x = 19.8, 21.5$ and ≈ 26 MeV (1979JO05; brems.). Monoenergetic photons with $E_\gamma = 8.5$ to 39.7 MeV have been used to measure the (γ, n) and the $(\gamma, 2n)$ [above 10 MeV] cross sections. The giant dipole resonance, 6 MeV broad, is centered at 23 MeV; a pigmy resonance is also observed at 13 MeV. Most of the GDR strength decays to $T = 1$ states in ^{16}O : this implies a $T = \frac{3}{2}$ assignment for the main part of the GDR. A broad structure, of $T = \frac{1}{2}$ nature, with $28 < E_x < 36$ MeV is also reported (1980JU01). For radiative widths see Table 17.13. See also (1977AJ02).

50. $^{17}\text{O}(e, e)^{17}\text{O}$

The ^{17}O charge radius, $\langle r^2 \rangle^{1/2} = 2.710 \pm 0.015$ fm, based on $\langle r_{17}^2 \rangle^{1/2} / \langle r_{16}^2 \rangle^{1/2} = 1.0015 \pm 0.0025$ (1978KI01). (1979MI09) report $\langle r_{17}^2 \rangle^{1/2} - \langle r_{16}^2 \rangle^{1/2} = -0.008 \pm 0.007$ fm. Considerable deviation from single-particle predictions is observed in the elastic scattering for an effective momentum transfer range of 0.55 to 2.8 fm⁻¹ (1979HY01). Inelastic scattering is reported to a number of ^{17}O states: see Tables 17.14 and 17.15. The data of (1977NO06) show a broad dipole resonance centered at 22–23 MeV with strength extending down to 10–12 MeV. A smaller resonance, with a form factor consistent with C2, is found between $E_x = 17.5$ and 19.6 MeV (1977NO06). The transitions to $^{17}\text{O}^*(0.87, 5.08)$ can be described as single-particle transitions (1978KI01). See also (1980HY1A) and (1978AR04, 1979AR1F, 1979ZA1C, 1980BO04, 1981LI1N; theor.).

1. ¹⁷F(β^+)¹⁷O $Q_m = 2.762$

Two recent measurements of the half-life of ¹⁷F are 64.31 ± 0.09 sec (1977AZ01) and 64.80 ± 0.12 sec (1977AL20): the weighted mean of these is 64.49 ± 0.16 sec; $\log ft = 3.36$. Earlier values are listed in (1971AJ02, 1977AJ02). The upper limit for the β^+ decay to ¹⁷O*(0.87) is $< 3.4 \times 10^{-4}$ per decay (1969GA05) [$\log ft > 5.6$]. Excitation functions for protons have been measured for $E(^3\text{He}) = 2.5$ to 18 MeV [see (1977AJ02)]: some large structures are observed. The polarization of the p_0 group has been studied at $E(^3\text{He}) = 9.8$ MeV. The elastic scattering of ^3He (reaction (d)) and the yield of α -particles (reaction (e)), studied in the ranges $E(^3\text{He}) = 4$ to 7 MeV and 2.5 to 8.5 MeV, respectively, show some evidence of structures (1970KN01, 1972MO39): see the discussion in (1977AJ02). See also ^{16}O and ^{16}F here, and ^{13}N , ^{14}N and ^{15}O in (1981AJ01).

10. $^{15}\text{N}(^3\text{He}, n)^{17}\text{F}$ $Q_m = 5.0097$

Angular distributions have been reported to most of the states of ^{17}F with $E_x < 8.1$ MeV at $E(^3\text{He}) = 3.8$ and 4.8 MeV: see (1977AJ02). Neutron groups have also been reported to ^{17}F states at $E_x = 11.195 \pm 0.007$, 12.540 ± 0.010 and 13.059 MeV, with $\Gamma < 20$, < 25 and < 25 keV, respectively. Angular distributions at $E(^3\text{He}) = 10.36$ and 11.88 MeV lead to $J^\pi = \frac{1}{2}^-$ for $^{17}\text{F}^*(11.20)$ [$L = 0$], $\frac{3}{2}^-$ or $\frac{5}{2}^-$ for $^{17}\text{F}^*(12.54)$ and $(\frac{3}{2}^-, \frac{5}{2}^-)$ for $^{17}\text{F}^*(13.06)$. These three states are probably the first three $T = \frac{3}{2}$ states in ^{17}F (1969AD02). The branching ratios for transitions to $^{16}\text{O}^*(0, 6.05, 6.13)$ for $^{17}\text{F}^*(11.20)$ and for the analog $T = \frac{3}{2}$ state in ^{17}O are displayed in Table 17.11: the ratios of the reduced widths are quite different in the two mirror nuclei (1970MC02, 1973AD02).

11. $^{15}\text{N}(^{11}\text{B}, ^9\text{Li})^{17}\text{F}$ $Q_m = -18.138$

At $E(^{11}\text{B}) = 115$ MeV $^{17}\text{F}^*(0, 5.22)$ are strongly populated (1979RA10).

12. $^{16}\text{O}(\text{p}, \gamma)^{17}\text{F}$

$$Q_{\text{m}} = 0.6004$$

$$Q_0 = 600.35 \pm 0.28 \text{ keV (1976RO1T)}.$$

At low energies the direct capture to $^{17}\text{F}^*(0, 0.50)$ is observed: see (1971AJ02, 1977AJ02). Extrapolation of cross-section data leads to $S(0) \approx 8 \text{ keV} \cdot \text{b}$: see (1977AJ02). In addition to two $T = \frac{1}{2}$ resonances, five resonances corresponding to $T = \frac{3}{2}$ states are observed in the γ_1 and $\gamma_0 + \gamma_1$ yields: see Table 17.20 for the reported parameters. The lowest $T = \frac{3}{2}$ states of even parity at $E_{\text{x}} = 13.27$ and 14.02 MeV [$J^\pi = (\frac{1}{2}^+)$ and $\frac{5}{2}^+$] (see Table 17.21) are not observed here: $\Gamma_{\gamma} \leq 7$ and ≤ 11.8 eV, respectively (1975HA06). The (E1) values for the $T = \frac{3}{2}$ states are in good agreement with shell model 2p-1h calculations using realistic Kuo-Brown interaction matrix elements (1975HA06).

The $(\gamma_0 + \gamma_1)$ yield at 90° has been studied for $E_{\text{p}} = 15.75$ to 31.66 MeV: it shows the giant dipole resonance centered at $E_{\text{x}} = 22$ MeV with a width of ≈ 5 MeV and a pigmy resonance centered at 17.5 MeV. The integrated strength of the, mainly $T = \frac{1}{2}$, giant resonance is $10 \text{ MeV} \cdot \text{mb}$: the observed strength distribution is on good agreement with odd parity 2p-1h, 1p excitation calculations. The pigmy resonance is due to $f_{7/2} \rightarrow d_{5/2}$: the main $f_{7/2}$ strength lies in two states at $E_{\text{x}} = 16.9$ and 18.0 MeV (1975HA07). See also (1979BL1F), (1981CA1D), (1975ZI1A; astrophys.) and (1977AL18; theor.).

Yield curves for elastic protons, protons scattered to $^{16}\text{O}^*(6.05, 6.13, 6.92, 7.12, 8.87)$ and for γ -rays from $^{16}\text{O}^*(6.13, 6.92)$ have been studied at many energies up to $E_p = 46$ MeV: see Table 17.19 in (1971AJ02) and (1977AJ02) for the earlier work and (1981KR1B; $E_{\bar{p}} = 8.5$ to 10.6 MeV; p_0), (1979DA11; $E_{\bar{p}} \approx 14.4$ MeV; p_0). The observed resonances are displayed in Table 17.21.

Polarization results have been reported at $E_p = 3.47$ to 49.4 MeV [see (1977AJ02)] and at $E_p = 40$ MeV (1978MO14; p_5), 42.5, 44.0 and 49.3 MeV (1977PE09; p_5), 65 MeV (1979SA38, 1981SA1F; p_0), 135 MeV (1980KE14; p_2, p_4), 800 MeV (1979AD03, 1979GL1C; $p_0, p_{1+2}, p_3, p_4, p_5$) and 1 GeV (1978AL1G, 1978AL1X, 1980AL09). Polarization in quasi-elastic scattering (reaction (b)) has been studied at $E_p = 200$ MeV by (1976KI10, 1980KI06) and 635 MeV (1977NA29, 1978NA18). For reactions (c) and (d) see (1977AJ02). For reaction (d) see (1981DY03). For spallation measurements see (1976IN04, 1977MO1C) and (1979VD02). For antiproton scattering see (1981AU01; theor.).

The excitation function for d_0 ($\theta = 70^\circ$) has been measured for $E_p = 21$ to 38.5 MeV. A strong resonance is observed at $E_p = 24$ MeV: see Table 17.21. Polarization measurements are reported at $E_p = 65$ MeV (1981HO1L; d_0), 30.3 MeV [see (1977AJ02)] and $E_{\bar{p}} = 200$ MeV (1981LI1B). See also ^{15}O in (1981AJ01) and (1979CA1A).

The excitation function ($\theta = 70^\circ$) for tritons has been measured for $E_p = 32$ to 39.5 MeV: no structure is observed [see (1977AJ02)]. Differential cross sections and analyzing powers have been studied at $E_p = 43.8$ MeV for the transitions to $^{14}\text{O}^*(0, 5.17, 6.29, 6.59, 7.78, 9.72)$ and $^{14}\text{N}^*(0, 2.31, 3.95, 5.11, 7.03, 9.17)$: attempts to fit the analyzing powers with zero-range DWBA were only successful for the first pair of analog states [$^{14}\text{O}_{\text{g.s.}}, ^{14}\text{N}^*(2.31)$] (1974MA12). For other polarization measurements see (1977AJ02). See also ^{14}N and ^{14}O in (1981AJ01) and (1977HA1P).

$$17. \text{}^{16}\text{O}(\text{p}, \alpha)^{13}\text{N} \qquad Q_{\text{m}} = -5.2185 \qquad E_{\text{b}} = 0.6004$$

Excitation functions of various α -groups and activation functions have been measured from threshold to $E_p = 44$ MeV: see Table 17.19 in (1971AJ02) and (1977AJ02) for the earlier work and (1977GR17; 6.6 to 10.4 MeV; σ_{t}). Observed resonances are displayed in Table 17.21. Some broad structures have been reported above $E_p \approx 15$ MeV; particularly strong peaks appear at $E_p \approx 22$ and 25.5 MeV: see (1977AJ02).

This reaction is involved in explosive burning in stars: see (1977AJ02) for earlier work and (1977GR17; $S_0 = 4 \pm 3$ b at $E_p(\text{cm}) = 6.5$ MeV). See also (1977CL1F).

Slow neutron thresholds have been observed corresponding to the ground and first excited states of ^{17}F : see (1971AJ02). The E_x of $^{17}\text{F}^*(0.50)$ is 495.33 ± 0.10 keV (1966AL10; from γ -measurement); $\tau_{\text{m}} = 407 \pm 9$ psec (1964BE15). Neutron groups have been observed corresponding to $^{17}\text{F}^*(0, 0.50, 3.10, 3.86, 4.70)$. Angular measurements have been obtained for the n_0 and n_1 groups ($l_p = 2$ and 0 , respectively: $J^\pi = \frac{5}{2}^+$ and $\frac{1}{2}^+$) for $E_{\text{d}} \leq 12$ MeV: see Table 17.21 in (1971AJ02) and (1972AN21; $E_{\text{d}} = 3.10, 3.40$ and 3.66 MeV). $$19. \text{}^{16}\text{O}({}^3\text{He}, \text{d})^{17}\text{F} \qquad Q_{\text{m}} = -4.8932$$

At $E({}^3\text{He}) = 18$ MeV, angular distributions of the deuterons to $^{17}\text{F}^*(0, 0.50, 3.104 \pm 0.003, 3.857 \pm 0.004)$ have been measured. The spectroscopic factors for $^{17}\text{F}^*(0, 0.50)$ are 0.94 and 0.83 . Two-step processes appear to be involved in the excitation of $^{17}\text{F}^*(3.10, 3.86)$ (1975FO16). Angular distributions have also been measured at $E({}^3\text{He}) = 30$ MeV (1977KO2H; to $^{17}\text{F}^*(5.1, 5.7)$) and at $E({}^3\vec{\text{He}}) = 33$ MeV (1980LU03, 1981RO1H; d_0, d_1). (b) $^{16}\text{O}(^{13}\text{C}, ^{12}\text{B})^{17}\text{F}$ $Q_m = -16.933$

Angular distributions have been measured at $E(^{12}\text{C}) = 76.8$ MeV (1977MO1A, 1979MO14; $^{17}\text{F}^*(0, 0.5)$) and at $E(^{13}\text{C}) = 105$ MeV (1979RA10; $^{17}\text{F}_{\text{g.s.}}$).

24. $^{16}\text{O}(^{14}\text{N}, ^{13}\text{C})^{17}\text{F}$ $Q_m = -6.9503$

Angular distributions involving $^{17}\text{F}^*(0, 0.5)$ have been measured at $E(^{14}\text{N}) = 76.2$ MeV (1977MO1A, 1979MO14) and 155 MeV (1975NA15, 1976NA09).

25. $^{16}\text{O}(^{16}\text{O}, ^{15}\text{N})^{17}\text{F}$ $Q_m = -11.5272$

Angular distributions involving $^{17}\text{F}^*(0 + 0.5)$ have been measured at $E(^{16}\text{O}) = 95.2$ MeV (1977MO1A, 1979MO14).

26. $^{17}\text{O}(p, n)^{17}\text{F}$ $Q_m = -3.544$

Angular distributions of the n_0 and n_1 groups have been obtained for $E_p = 6.95$ to 13.50 MeV (n_0) and 6.95 to 12.45 MeV (n_1). There appears to be collective enhancement in the $L = 2$ transition to $^{17}\text{F}^*(0.5)$. A large spin-flip term in the effective two-body force is necessary to account for the strength of the ground state transition (1969AN06). See also ^{18}F in (1983AJ01).

27. $^{17}\text{O}(^3\text{He}, t)^{17}\text{F}$ $Q_m = -2.780$

Angular distributions have been studied for t_0 and t_1 at $E(^3\text{He}) = 17.3$ MeV [see (1977AJ02)] and for t_0 at $E(^3\vec{\text{He}}) = 33$ MeV (1981BA1G).

28. $^{17}\text{Ne}(\beta^+)^{17}\text{F}$ $Q_m = 14.53$

See ^{17}Ne .

29. $^{19}\text{F}(\gamma, 2n)^{17}\text{F}$ $Q_m = -19.582$

See ^{19}F in (1983AJ01).

30. $^{19}\text{F}(p, t)^{17}\text{F}$ $Q_m = -11.100$

Angular distributions have been measured for the $t_0 \rightarrow t_3$ groups at $E_p = 22.8, 42.4$ and 45 MeV: see (1977AJ02).

31. $^{20}\text{Ne}(p, \alpha)^{17}\text{F}$ $Q_m = -4.1306$

See (1977GR17, 1980KO1Q) and (1977AJ02).

32. (a) $^{20}\text{Ne}(^3\text{He}, ^6\text{Li})^{17}\text{F}$ $Q_m = -8.151$

(b) $^{22}\text{Ne}(^3\text{He}, ^8\text{Li})^{17}\text{F}$ $Q_m = -15.993$

At $E(^3\text{He}) = 75$ and 88 MeV $^{17}\text{F}^*(0, 0.5)$ have been populated in both reactions (1978KE06).

^{17}Ne
(Figs. 8 and 9)

GENERAL: See also (1977AJ02).

Theory and reviews: (1975BE56, 1977CE05, 1978GU10, 1979BE1H, 1979WO07).

Other topics: (1981GR08).

Mass of ^{17}Ne : The mass excess adopted by (1977WA08) is 16.478 ± 0.026 MeV, based on unpublished data. We retain the mass excess 16.48 ± 0.05 MeV based on the evidence reviewed in (1977AJ02).

1. (a) $^{17}\text{Ne}(\beta^+)^{17}\text{F}^* \rightarrow ^{16}\text{O} + \text{p}$ $Q_m = 13.93$
 (b) $^{17}\text{Ne}(\beta^+)^{17}\text{F}$ $Q_m = 14.53$

The half-life of ^{17}Ne is 109.0 ± 1.0 msec (1971HA05). Earlier values (see (1971AJ02)) gave a mean value of 108.0 ± 2.7 msec. The decay is primarily to the proton unstable states of ^{17}F at 4.70, 5.52 and 6.04 MeV $J^\pi = \frac{3}{2}^-$, $\frac{3}{2}^-$ and $\frac{1}{2}^-$: see Table 17.23. The super-allowed decay to the analog state [$^{17}\text{F}^*(11.20)$] has $\log ft = 3.29^{+0.04}_{-0.07}$. The character of the decay leads to $J^\pi = \frac{1}{2}^-$ for $^{17}\text{Ne}_{\text{g.s.}}$ (1971HA05). See Table 17.3 for a comparison of the mirror ^{17}N and ^{17}Ne decays and Table 17.11 for the decay of $^{17}\text{F}^*(11.20)$. See also (1978RA2A).

^a (1971HA05). See also Table 17.23 in (1971AJ02).

^b $\log ft$ values calculated by (1971HA05) using an atomic mass excess of 16.517 ± 0.026 MeV [$\tau_{1/2} = 109.0 \pm 1.0$ msec] rather than the presently adopted 16.48 ± 0.05 MeV. Since this energy difference leads to quite small changes, the original calculations are quoted here. However, Table 17.3 (which compares the analog decays) shows corrected ft values.

^c Calculated branchings, based on the mirror ^{17}N decay.

^d A proton group with $E_{\text{cm}} = 2.83$ MeV has been observed: the level in ^{17}F to which it corresponds is not known.

^e See also Table 17.11.

^{17}Na

(Not illustrated)

^{17}Na has not been observed: its mass excess is predicted to be 35.61 MeV by (1966KE16). It is then unbound with respect to breakup into $^{16}\text{Ne} + \text{p}$ by 4.3 MeV and with respect to breakup into $^{14}\text{O} + 3\text{p}$ by 5.7 MeV.

References

(Closed 01 July 1981)

References are arranged and designated by the year of publication followed by the first two letters of the first-mentioned author's name and then by two additional characters. Most of the references appear in the National Nuclear Data Center files (Nuclear Science References Database) and have NNDC key numbers. Otherwise, TUNL key numbers were assigned with the last two characters of the form 1A, 1B, etc. In response to many requests for more informative citations, we have, when possible, included up to ten authors per paper and added the authors' initials.
